I already have an SP-600 in near mint condition that
stays inside next to all of my other nice stuff. This latest
radio will never be mint, but will end up in my garage
shop to replace a Realistic DX-160. Useful for listening
to the 40 meter swap net, and WWV to cal my counter
timebase.

Steve
p.s.-I'm not a 'leave it on the shelf' collector....all of my
equipment gets used.

Thanks Scott. That sounds reasonable. I am going to try and find some info
before I take it all apart to draw a schematic. The power cable is bery
wimpy (two wire lamp cable) and the output is thru the center of a coax
connector. Wil change both before actually testing.

"I've never seen a radio in this kind of condition, and thats
in 35+ years as a ham and collector of radio stuff.
I cannot describe its condition.....you'd have to see
(and smell) it. It will be a major challenge to restore."

Perfect one to restore. I once got an amplifier that apparently had parasitics. Meters broken; face and inside spray-painted and sides and front panel apparently hit with a chain. Band-switch burnt beyond recognition. No bottom cabinet (roll around type), It looked ok when I got done and worked, but did not look like original. Felt good putting that sucker back on the air.

My best work was a Johnson Adventurer that had about 10 extra holes in the front panel. The panel was restored, although I never duplicated the original Johnson paint scheme.

Now, if only I had an engraving machine to make new engraved front panels.

Hey Brian, you did a good job! That one radio - the "black"(?) one (looked
black to me) looked really nice. The one which had the white lettering
standing out. Good Pics and one hell of a good job! Did you redo the
lettering with a "model" paint brush or what? Looks like you had a pretty
steady hand if ya did.

Not getting it to do it's job is failure, if it's if it sees a lot of
use, ugly is okay until you can do better as long as that won't matter.
A threat to the set's life is the best reason not to try until it can
be saved, but ugly is a great teacher.

JUST A WARNING TO ALL RESTORERS OF RAT INFESTED RADIOS......

Hantavirus pulmonary syndrome

Definitionï¿½ï¿½ï¿½

Hantavirus is a disease characterized by flu-like symptoms followed by respiratory failure.

Causes, incidence, and risk factors

Hantavirus has probably caused people to get sick for years in the United States, but it was not recognized until recently.

A 1993 outbreak of fatal respiratory illness on an Indian reservation in the Four Corners area (the border of Utah, Colorado, New Mexico, and Arizona) led epidemiologists to the discovery of hantavirus as the causative agent. Since that discovery, hantavirus disease has been reported in every western state, and in many eastern states.

Hantavirus is carried by rodents, particularly deer mice, and is present in their urine and feces. The virus does not cause disease in the carrier animal. Humans are thought to become infected when they are exposed to contaminated dust from the nests or droppings of mice.

The disease is not, however, passed between humans. Contaminated dust is often encountered when cleaning long-vacated dwellings, sheds, or other enclosed areas.

The federal Centers for Disease Control and Prevention (CDC) reported that rodents carrying hantavirus have been found in at least twenty national parks and that it is possible that the virus is in all of the parks.

Epidemiologists at the CDC suspect that campers and hikers may have a higher chance of contracting the disease than most people. This is due to the fact that they pitch tents on the forest floor and lay their sleeping bags down in musty cabins.

So far, however, of the more than 100 cases that have been reported in the U.S., only two were directly linked to camping or hiking. Most people who are exposed have come into contact with rodent droppings in their own homes.

The initial symptoms of hantavirus disease closely resemble influenza. The disease begins abruptly with fever, chills, muscle aches (myalgia), headache, nausea and vomiting, and malaise. A dry cough may be present. The fever may be higher in younger people than in older people.

For a very short period, the infected person feels somewhat better, but this is followed within a day or two by an increased respiratory rate caused by a seepage of fluid into the lungs. The initial shortness of breath is subtle and the patient may be unaware of it, but progression is rapid. The patient ultimately develops respiratory failure.

An effective treatment for hantavirus is not yet available. Even with intensive therapy, more than half of the diagnosed cases have been fatal.

Well.. anything's possible, but I have original original Hammarlund and MIL books for the entire series, plus the factory brochures. None show handles nor are they listed in any parts breakdown (IPB)that I have. Having said that, I'm sure some agencies machine shop could have readily installed them. One point... I have seen some SP-600's that came out of NSA that had countersunk holes on the extreme left and right edges, aligned with the rack screw holes. I'm told they were for a visual security cover for the front panel. At any rate, if anyone has a mfgr's picture of one with handles, I'd like to see it. I may want to retrofit. As I mentioned originally, they would look good.

Hantavirus will survive outsite the host body for only several days when exposed to air at room temperature. I would consider any radio hantavirus safe provided it was kept out of rodent infested area for a week or longer. There is no need to be excessively paranoid after the quarantine period is over.

Hantavirus is susceptible to UV light so sun light would inactivate viral particles much faster. Viral particles are protected by a layer of lipids so an exposure to a surfactant like a detergent or to a solvent like isopropanol (rubbing alcohol) would inactivate them fast as well.

Those with allergies would be however still some concerned about exposure to mold spores and similar allergens that may be present on the surface of droppings.

Another hobby I have been into is restoring and collecting pinball
machines. I picked up an old machine a couple of winters ago that sat
in a barn for years. Brought it home and cleaned out the rats nests
and left in the garage. Summer hit and the rat piss that had soaked
into the wood stunk BIG time. Used javex to try to disinfect but no
match for the smell.

Sold it to a guy who has posted in this group. He said it eventually
faded but...

I won't buy anything in the winter that is wood that has had a nest in
it.

I am putting up for sale my "Ultimate Collins S-Line". I just don't use it much and I need to sell it. I am sure that I will kick myself in the future. But here
goes:
All of this gear is CCA EXCELLENT:
1. Collins Round Emblem 75S3-C Receiver. MCN 1674(SN Sicker has fallen off, See picture) Includes 2.1 SSB Filter and 500 Hz CW Filter. Very Nice Works Perfectly. It has T-9. Some extra Crystals. Gone Through by Dennis Brothers.
2. Collins Round Emblem 32S3-A Transmitter. SN 3127. Very rare and very nice. Works Perfectly. Gone Through by Dennis Brothers.
3. Collins Round Emblem 516F-2 Power Supply and RE Cabinet. SN 22007. Looks and works like new. NO MODs.
4. Collins Round Emblem 312B-4 Station Console. SN 70368/MCN 5368. Spotless!!
5. Collins Round Emblem 30L-1 Amplifier. This one is practically new.
6. Collins Round Emblem SM-3 Microphone with original box. SN 5705. A few spots on base, but very good.
7. Collins Crystal Pack, complete with Pouch and Extractor, Looks brand new.
8. All equipment includes original Collins Manuals and all Interconnecting Cables.
9. Original Collins 1978 Brochure and Price List, includes all the above equipment.
This is a very nice, rare S-Line. You would be hard put to find a nicer one. Price is $8900.

I have lots of digital pictures of this equipment. The pictures are on my website at the following link: http://hug-a-bug.com/CollinsSale.html
Thanks, Charlie Hugg, K5MBX, CCA#307

Sounds like a candiate for the dishwasher treatment. Believe it or not, several of our members report running really cruddy radios through the dishwasher with good results. You might do a Google Groups search to find the relevant details re sealing up transformers, etc.

It may not fit in a dishwasher. I spray em down with Simple Green and let
sit for 1/2hr then rinse. Never had a problem. The military does it, did you
know that?

When did they change to Simple Green from duPont 409? We bought it by
the palletload.

I'm sure your right. I was just refering to the washing. I just think SG is good smelling and does a great job and is biodegradable. I think you can dribk the stuff and it wont kill ya? Don't hold me to it though! :)

Brought it home and cleaned out the rats nests
and left in the garage. Summer hit and the rat piss that had soaked
into the wood stunk BIG time. Used javex to try to disinfect but no
match for the smell.

Ammonia (Javex) on urine is much like gasoline on fire. The urine smell has
a big ammonia component. You need one of ammonia's enemies, such as chlorine
or hydrogen peroxide.

Caveat....

Don't spray chlorine bleach on fresh urine.. the resulting gas is NASTY..
```

True- I should have said this MUST be done outside or under a fume hood. The peroxide is less noxious but it must be the 30% pool shock/ water treatment grade. Fabreze or proprietary enzyme treatments for urine work on milder cases if the wood is repeatedly saturated and allowed to dry.

Shucks, for "Ultimate" I was expecting a 30 S-1, but they are a whale
of a nice station. I had the S-line, plus the KWM2A, and the old
KW-S1/74A4 combo to heat the shack.<:-))

To get rid of most odors, especially cat urine, combine an 8 oz. bottle of Hydrogen Peroxide with a level teaspoon of Baking Soda, add a drop of any handsoap, pour on the affected area, rug, wood, concrete. Let it dry, a couple of applications may be needed. I've had more success with this than ANY store bought stuff.

Both you guys are amazing! I have read Phil's resoration pages about a hundred times (I think I have most of it memorized). I have a very nice SX-28. While I am still trying to fix the AVC, the receiver is sensitive on all bands and sounds wonderful through that PM-23. I keep reading Phil's description on changing the caps in the RF area, trying to get the nerve to go in there. I have checked or replaced everything else. Great photos, Brian. If you ever get bored and miss working on one, let me know! hehe

I have a JX-26 (R-274C) with handles. It is the only one of the 5 or 6
of these that I have with handles. I don't think they were add-ons, they
appear to have always been there.

Just take it slow and methodical, make notes. Mark any leads you cut to make
it easier etc. Be careful of the wafer switches when you ease out the band
switch shaft etc....
If we can do it ,you can.

BH

Chlorine + ammonia = ammonium chloride (possibly other nasty stuff). Bleach bottles usually have a warning about mixing bleach with other cleaning agents, in particular those containing ammonia.

I can definately agree with BH on the notes........It is a pain in the ass
to be taken away from a project and if it is to be a day or so, trying to
recall where you left off or maybe any voltages you had, results, parts you
swapped out, were hunting for, etc. Maybe it be family issues or other - can
"really" make you lose track. Hopefully too - you have a spot where you can
leave the radio and no one will disturb it. The electronics part - for me,
is fun. The "cabinet" part - BH, Phil, etc........ WOW - they've done such
good work! Fortunately any sets I've had to date didn't have to be redone
cabinet wise. I would have a time at it, trying to match their neatness -
there. But if I had to choose, I'd rather do the metal cabinets - over the
wooden ones. Some of these guys - those doing the wooden ones - have done
MARVELOUS work.......

Maybe it was covered and I missed it - any ideas for "roach" droppings, etc.? I've used "commercial" "relay" cleaners with "some" success, but there is still that DISGUSTING residue. Fortunately, I've not had a lot of radios like that, but even two or three is too many.

Must be popular out here. Gateway Computers service center in
Manhattan Beach, CA had an ENORMOUS sign on the wall near the
service counter. "If your computer has roaches inside, you WILL
be billed the FULL amount to de-infest this building."

Well, as some comedian often says - "There's your sign!" I guess it is fitting..... I think I've only dealt with one mouse/rat issue. Actually, if I had my choice, I'd take the mouse/rat.

Like I said, I've used commercial relay cleaners with some success but it doesn't clean it all out. Thought maybe someone had other ideas!

Close but not quite. Ammonium chloride is a fairly harmless and
non-volatile salt. I suppose that could be an ultimate product, but
not the major problem.

Bleach + ammonia --> CHLORINE GAS which will indeed ruin your day.
This could be the same reaction a previous poster mentioned about
putting bleach on pee - if the pee has broken down to ammonia OR there
are nitrogen compounds in the pee that react similarly, you could get
chlorine gas from that too.

Had a Zenith console that was moused, I used some kind of cheap dollar
store lavender flavored cleaner spray on it just to get the dirt off
before going after the smell. Now whenever I use that stuff, I have a
nausea reminiscent of the mouse pee. Turns out much of what I was
smelling was the cheap perfume in the cleaning product, blended with
pee. That product is now forever associated with mouse pee in my
olfactory memory.

Another funny story: I do some volunteer work in a barely-occupied
warehouse, and the bathrooms hadn't been used forever. One night I
poured sudsy ammonia in the urinals to let them soak. Next day
another volunteer decides to go in there with a bottle of bleach! :-o
He was not a happy man when the green chlorine fumes started wafting
up.

Sorry I'm late to this thread but just for interest I checked my T-90. I don't think you have a problem at all. I get 183 and 202 ohms. It works fine with excellent modulation. All original parts other than the caps I replaced and a few out of spec resistors.

Must have been lucky. I had to open the rotary knob types to adjust
them when I worked there and I never saw a single roach. They like to
eat wiring I know and I saw someone with them spend a lot ot money
replacing his TV, VCR and stereo stuff once.

Hmm. OK, how about talking to a no-code with a yet-to-be-activated
General? I sat for & took the Tech, passed and they mentioned I could
take the General. Great. Passed that one as well. Working on Morse
now.

Missed the Extra, though, by a few questions.

Was my first shot at any exam.

Neither a Tech nor a General makes one a Ham, though.
Nor Morse.

That only qualifies you to be a good student of the avocation.
I don't expect to be really good at ham radio until I've played
around
with a transceiver for a year or two, maybe. Still need to learn
the lingo,
learn electronics, get my feet wet, build a receiver and maybe a
transmitter,
blow up a few caps..you know, OJT. Plus lots of hamfests where I'll
be looking for a cute hamette.

When I finally DO get a rig of some kind, I sorta kinda might be
Ready
for going after QSOs.

Even from folks who think I've got an honorary degree.

Good DX & 73,
Terry, KC9KEL newly minted

Sonny, I will take it if all parts are there, it is not rusty, cabinet is not bent, front panel lettering is intact, minimal front panel scratching. Let me know condition with a bit better explanation and it is sold!!!!

Tnx Ed KC4FD

Any 12 year old can learn code in 2 weeks. Getting rid of it would not
dumb down Ham radio at all. Code is a good thing to know. Whether you
use it or not is a personal preference. I think programming you're own
software to send code yourself and building your own radio is a lot more
technical than learning code.

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.shortwave

I was cruising around the HF bands last night look to see if I could snag the BBC in my area. I stumbled across a SSB HF broadcast of Alaskan seas conditions. This caused me to do a search on Google for HF marine stations. After drilling into various sites, I hit:

http://www.shipcom.com/frequencies.html

I was surprised to see the front panel of an old BC-221 (SCR-211) staring back at me. It is good to see that venerable old frequency meter still considered "cool" enough to be part of a commercial web site.

Steve.

AKA LM. I was lucky enough to find a nearly mint one
complete with power supply and original calibration books,
they are still very useful.
The site you reference has two familiar calls, once
coastal telegraph stations: KLB and WLO. Years ago I learned
code partly from copying ship traffic. Both RCA and MacKay
main stations (KPH and KFS in the West and WCC and WSL in
the East) sent about two hours of press every day, machine
sent at about 25 WPM. That went away sometime in the early
1980's when it was switched to teleprinter.

I have what is probably a JX-21 (the tuning unit cover
was missing when I got it) which is fitted for rack handles.
I have also seen pictures of receivers with the handles but
have never seen an actual receiver with them. There were
handles on some of the VLF versions of the RX, they look
like they get in the way.

3808. SP-600 Rebuilding Experiences

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-10-06 23:02:40 UTC
From: Richard Knoppow <dickburk@ix.netcom.com>
Message-ID: <kgBVg.4080$Lv3.3951@newsread1.news.pas.earthlink.net>
Source record: 10658

I have just gone through rebuilding two SP-600's, neither is quite perfect yet, but close. I would like to hear the experiences of others: problems encountered, etc., especially with dial calibration. My receivers are a JX-21 or possibly a JX-26 (top cover was missing) and a JX-17. The JX-21(?) was built about 1955 judging from the dates marked on some components. It is an R-274C built on a 1954 contract. The JX-17 appears to have been rebuilt at a military shop some time in its life (all ceramic caps)and has a date late in 1955 stamped on the inside of the front panel. I've had both receivers for many years but have recently decided to get them as close to mint performance as I can.
I can find no specification on dial accuracy for either model. I beleive I saw a spec of 0.25% in one Hammarlund ad, this is not really a very tight spec and both receivers make it. Should it be better? The design of the main tuning capacitor is such that its adjustable and I understand that each capacitor went through a factory adjustment proceedure to get each section to match specs. Does anyone know anything further.
BTW, I have visited the usual SP-600 sites on the web. In particular the "Hammarlund Historian" and Andy Moorer's site, both of which are quite helpful. I also obtained all the manuals and othere material available from these sites and from "BAMA". One of these guys is sittign about 8 feet from me right now glowing at me:-)
This group seems to be mostly FS and WTB advertising so I hope this post is still on topic here.

I will pass along a method of cleaning used at
Hewlett-Packard many years ago. We washed equipment sent in
for overhaul using a paint spray gun filled with warm water
and dishwashing detergent. This, along with a soft brush,
would remove most dirt and junk. Once washed the equipment
was rinsed off using a sprayer hose attachment and dried in
an electric oven for several days at about 130F. Remove
anything that can be damaged by moisture, meters for
instance. We also found a high rate of failure of
hermetically sealed transformers and chokes. This is
counterintuitive but if the seal is leaky moisture can get
in and has a hard time getting out again despite the baking.
I don't know what effect this will have on the ferrite cores
in the SP-600, maybe none.

I was surprised that this HF stuff was still going. I have a "new in
crate" BC-221-AK that I plan to put into sort of a museum of frequency
standards in the front entrance way of Novatech Instruments along with
the prototypes of our stuff and other company's stuff.

Steve.

You think that's bad? Wait until HF sounds 11 meters and you can't find a
decent contact anywhere. You'll see I was right.

I crawled out of my hole around restructuring time. Then the ARRL and FCC
screwed ham radio. I went back in my hole again. Now the FCC and it
appears with the blessings of the ARRL is planning to toss CW all
together. I come out of my hole to fight for the integrity of ham radio
once again, but when the R&O comes out eliminating CW, I'll crawl back
into my hole again. Leaving you and everyone else the problem of trying to
deal with poor behavior and operating practice on the bands. The result
of dumbing down licensing.

Outcome based education doesn't work, what makes you think outcome based
licensing will?

But people don't want to be skilled at anything anymore. They don't want to make an effort to learn CW, they may not make an effort to learn other things to advance themselves technically either.

Your home-page is a piece of filth.

PLEASE don't try to pass yourself off as being a good representative of ham
radio.

Richard,
I performed an electrical restoration on an SP-600 (JX-26)
last summer. The frequency accuracy was poor....WWV at
10 MHz was at 10.2 MHz (approx). What is worse IMO is the
tracking across the bands. The frequency at one end would be high,
but at the other extreme, it'd be low.

I'm sure this can be tuned out. I just haven't tried yet.

I'm in the process of bring back another JX-26 now, so if
you have any specific questions, you can write me off list.

Well, let's see... I've done four of them, to date. Maybe I've been lucky or something, but I haven't had too much of a problem aligning the dials. Perhaps my spec is not tight enough? At any rate, two of the four had tubular, vice disc, capacitors that had to be changed out. The worst problem, but doable, are those on each of the L/C elements in the turret and those under the RF box. Replacing the caps on the L/C elements for the LO may be of great help in dial alignment.

My JX-17 had bad caps on the 7.5mc to 14.5mc oscillator assembly. The problem was extreme instability. I replaced the bad guy. Since this was a 1% cap of specified value I built one of the right value from two dipped silver micas in parallel, measuring it on a bridge. The result was just about perfect calibration on that band and very good stability. I may have to change others.
I am aware of he problem with the Sangamo "Black Beauty" caps. they were all replaced with disc ceramics in my JX-17 but only in the RF deck of the JX-21, or perhaps its a JX-26. I've replace a number of them that were obviously bad but there nearly 60 in the receiver and not all are bad.
BTW, these ubicutous caps were originaly marketed by Sangamo as deluxe quality replacements for wax dipped paper caps. They are paper impregnated with Mylar in molded resin cases. I suspect the problem is that the casing is not stable and, as it drys out, disturbs the connection of the capacitor to the leads and also lets moisture in causing very high leakage. Black Beauties were used in a variety of high quality electronic equipment c.1950s and 1960s. Sangamo also sold dipped epoxy encapsulated versions of these sold as "Chocklate Drops". AFAIK, these have proven to be a lot more reliable.
But back to the calibration problem: I discovred that molded silvered mica capacitors, once considered to be most reliable of all, evidently suffer from a similar problem, i.e., they become unstable with age. One symptom is a rapid variation of capacitance sometimes called "scintillation" and that they can change value radically. For instance, the 51uuf caps used to resonate L-34, one of the 4 mhz IF coils, will change as the receiver heats up throwing off the tuning

of this stage. I changed this cap in both of my receivers. I found other bad guys in the JX-17 in various places, all molded silver mica types.
The main tuning capacitor of the SP-600 has stators which are fastened to the frame with three screws. The stators can move up and down and also sideways to some degree. The should be exactly centered but the up and down movement was evidently used in manufacture to adust the exact value of each section to the nominal value. I am about to try this on one of the receivers where I need to remove the RF deck anyway. The outside plates of the rotor sections are split but evidently plate bending was NEVER done and should not be done to calibrate the things. Somewhere, someone probably has the factory procedures but they do not appear to be on the web anywhere.
I have a lot of other unanswered questions about these receivers. So far, even after just a couple of hours I've found at least some of what I want in this news group, for which I thank everyone.
I should add that my JX-21 (or maybe JX-26) was bought as junk at C&H Surplus some 30 years ago. It was very cheap because it had wires sticking out of it. Someone had evidently begun to modify it to a JX-17. I removed the partial modifications and restored the original circuits. I then did a very large number of small repairs. The RX was missing the top cover for the capacitor compartment (I've just recently aquired one) the shield for the crystal switch (I made one but would like an original) and a couple of knobs, the RF Gain knob and one of the small Xtal control knobs. I found knobs enough like the originals to work.
Recently the main filter capacitor gave out and I decided to really bring the thing to life along with replacing the cap. I couldn't find an exact replacement but did find one of the correct physical size but slightly greater capacitance (not a problem :-)) but discovered some additional problem in the coarse of doing this.
The JX-17 was aquired in nearly mint condition many years ago but was in storage for a long time. That one has come back to life very well.
I get very frustrated by my lack of time to work on these guys and the difficulty of obtaining parts even here in the big city. I have gotten a liberal education about sources in the last few months. Perhaps I've just gotten old but I am a bit shocked at the ignorance of younger people about component level electronics. Oh, well, enough grousing.

I used to think the little 221 was a real useless piece of test gear.

Wow! Was I ever wrong.

Those things are so easy to use. And damned accurate!

I have one next to my recently restored TBW xmtr.

Great tool to have around.

But I did have to replace a bunch of paper caps in mine.

I suspect it will outlast me by a long shot.

Well, you can seal off the holes the adjusters come out
of. I would take the cans off because they will trap
moisture.

In 1966 the family did a car trip to Cape Cod. As a young ham, I was attracted to some huge rhombic antennas that we were driving past. At some point we found an RCA facility, knocked on the door and asked for a tour.

It was their ship-shore facility. There were rows of cubicles with a vibroplex key and a mechanical typewriter in each one. ISTR the receivers had an RCA logo and appeared to be late-WWII vintage. The transmitters were somewhere else. The whole room appeared to be essentially unchanged since the 30s, except for the receivers.

Nice picture. Sort of reminds me of the WWII surplus receiver sitting on my workbench waiting for me. Needs a new electrolytic and burnt out resistor.

On a different note, I noticed in the picture next to the 221, the 4 dipoles 90 degrees apart. I am experimenting with 800 mhz antennas and can only erect one in my attic. Don't want to mess with rotors. I wonder if you (or anyone) can advise how the 4 antennas are joined, I assume to one downlead (phasing ?, etc.).

Actually top posting is a sign of *experience*. Us guys that were on the internet back when it was run by darpa always top posted. That was because we were running very slow lines, typically 110 to 300 baud, and it was desirable not to have to wait through the down load of a dozen copies of the same quoted material as we progressed through a thread. Bottom posting forced everyone on the newsgroup to fully download every article waisting tons of our very limited bandwidth and time. Top posting allowed you to get right to the meat of the article in the first few seconds of downloading... and it allowed you the option of continuing to footnotes if you really needed to.

You newbies have dozens of ways of trying to impose your will on the group. Most of your so called rules of etiquette are simply you following the bottom posting convention that was set up as a default on internet explorer. Rn, trn, tin, and other premicrosloth news readers defaulted to top posting.

You are so spoiled by high bandwidth and large amounts of memory that you think that a posting arrives at your machine in its full length instantly.. and for all practical purposes, it does.

I can go either way. I do, however, get very tired of having to scroll through the same old quoted crap at the top of post after post... just to get to the bottom and find the highly informative, but typical, "me too" tacked onto the end.

Bzzzzzzzzzzzzzzzzzzzzzzzzzt!

My bullshit detector just went off real loud. Here is an authoritative
statement about ARPANET from one of Comer's books:

"Initially, most of the leased data circuits in the ARPANET operated
at 56 Kbps, a speed considered extremely fast in 1968 but slow by
current standards." -- Douglas E. Comer, Internetworking with TCP/IP,
Volume One, 3rd Edition, Prentice-Hall (1995), page 57.

300 baud, my ass! You should have been on a time sharing machine
connected directly to the 56K ARPANET, so don't bother to backpedal by
claiming dialup speeds. (And of course Usenet didn't even begin until
the 80's, shortly after ARPANET had ended.)

Don't try to bullshit someone who has forgotten more about the subject
than you have yet to learn.

Yep, those were the *backbones* of ARPANET. We had *ONE* at the University
of Maryland back in the 1970s. That leased line cost thousands of dollars
per month, and was paid for by darpa. Compare that to the backbones of today
which are measured in terrabits per second. These 56K backbones were
connected to mainframe computers that acted as concentrators, and provided
connections to other mainframes, and to thousands of users on timesharing
systems. Yes, I have that right, *thousands* of users shared a single 56K
backbone.

Those users that were local to the concentrator (eg, in the computer room)
were connected to the mainframe by various speed RS-232 lines, but those who
were on remote dial up connections were connected by good old bell 103,
110 to 300 baud modems.

> 300 baud, my ass! You should have been on a time sharing machine
> connected directly to the 56K ARPANET,

Yep, we were on timesharing machines, Univac 1106's, 1108's, and 1140's,
and as I said, thousands of users shared a single 56K leased line into
Darpanet. Do the math, if you can't, I'll help you:

56K/1000 = 56 bps.

If there were *only* 1000 users vying for the net at the same time, they
could each pump 56bps into the backbone. But there were many many more
than that, and they weren't always needing the net all of the time.

(hence the name concentrator)

so don't bother to backpedal by

I'm sorry, I don't backpedal for idiots. I don't brake for them either.

> claiming dialup speeds. (And of course Usenet didn't even begin until

Riiiight! Just because you can look up darpa on a wiki somewhere, doesn't
mean you can understand what you have read.

Thanks for taking the time to check your T-90, Chuck. Interesting
result. I hope to report that all is well with mine once it's fired up.

I can't dredge up the details from my memory but think the transmitter location was at Marion Mass. The receivers were probably either RCA AR-77 or the later AR-88 types. These are actually pretty good receivers. In the old days there were several different calls used but after WW-2 only one was used, WCC (Cape Cod). This was RCA's main east coast station. Its equivalent on the west coast was KPH. KPH had various locations but after WW-2 was co-located with the RCA Communications station on the Point Reyes peninsula above San Francisco. RCA Communications had its transmitters at Bolinas Point and receiver station at Inverness further up the peninsula. There is a web site dedicated to KPH. The call is a very old one, originally PH, for Palace Hotel, its original location, issued to the Marconi Company c.1907. There are evidently other transmitting sites on the east coast which have been preserved to some degree. FWIW, the main RCA Communications station in the east was on Long

Island with transmitters at Rocky Point and receivers at Riverhead. I don't know if there is anything at either location to indicate what was there. RCA Radiomarine also had a big installation at Tuckerton N.J. (WSC) the home of the famous 200,000 Watt Alexanderson alternator. This machine operated on a frequency near 100 khz and was kept in running order for many decades for "national security" purposes. I have no idea what became of any of this. Perhaps someone else in the group knows more. I suppose all this is at least partly O.T. here.

So you think that 1000 users at your location were always using
ARPANET simultaneously? Please don't tell me that someone gave you an
engineering degree, because you obviously didn't understand the course
work.

Comer's books on TCP/IP are standards, and they don't involve a wiki.
They happen to be in my library of reference textbooks, and they
happen to be standard references kept in all university libraries.

The claim about slow speeds on ARPANET and Usenet is quite stupid.
ARPANET and Usenet did not exist at the same time. ARPANET didn't use
TCP/IP protocol, and it gave way to what is now called the Internet
when TCP/IP became the standard packet delivery protocol. Shortly
after that, the message posting system called Usenet was formalized to
run on the Internet and on several other message delivery systems
(such as UUCP). So your reference to ARPANET is simply irrelevant.
ARPANET and Usenet never coexisted, making the claims about 300 bps
and other speed limitations total BS intended to impress the ignorant.

Enough said. Conversation ended. You don't seem to be worth any
followup messages until you do some additional reading.

Heh heh heh...the "high tech" of its time, a mere 30+ years
ago. "Speedy" Teletype Model 33s (?) and "high speed" 300
baud video terminals (with local memory to print out screens

on Teletypes) where I was using it. :-)

>(hence the name concentrator)

"Concentrators" still exist but in a vastly different form,
configuration, and specifications. As a personal computer
hobbyist since '76 I've not delved into them (no need to for
personal dial-up connections) but know many who are; they
have supplied some interesting literature on them as well as
in-person explanations.

>> so don't bother to backpedal by

Yes, the Amperex 5894 tube (equivalent to the Mullard QQV06-40A)
was used in the Eldico SSB-100 series of 100W output HF transmitters,
which first appeared in 1956.

And, it is a modern version of the 829, a dual tetrode used in radar service in WW II.

During the Korean war, the 4D32 that was used in the Viking I and a few other rigs was grabbed up by the military and none were available for civilian sale. So, the 829 was stuck in its place. I still have an 829 in mine. Many came from the factory that way.

The 5894 is a good tube. Besides use in parallel for the rf, it can be used as a modulator.

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.soldersmoke.com

Listen at: http://www.soldersmoke.com

SolderSmoke #34 (October 7, 2006) is now available
on http://www.soldersmoke.com

Ashhar Farhan joined us from India for #34:

-- BITX-20 transceiver.
-- HB in India.
-- EMRFD.
-- W7ZOI influence.
-- Hans Summers.
-- Quadrature rigs.
-- DSB and PSK31.
-- Homebrew test gear.
-- The importance of measurement
-- Farhan's 'scope.
-- Homebrew heartaches.
-- Homebrew spirit.
-- Symmetry.

Tired of listening to Led Zepplin or NPR on your
I-Pod? Wouldn't you like to be able to carry with
you the kinds of ham radio conversations that you
listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in
London, England meet regularly on the ECHOLINK system
to discuss their homebrew radio projects. We are
making them available as PODCASTS.

RSS FEED: You can subscribe to the program, have
them downloaded to your MP-3 player, and listen to
them at your convenience. To subscribe, just cut and
paste this URL into your I-poder (or similar)
software.
http://www.soldersmoke.com/soldersmoke.rss

If you don't have an MP3 player you can just go to the
site below and listen to the latest program (and
earlier editions) using the audio software on your

computer.

http://www.soldersmoke.com

All our programs are available here.

We hope you enjoy the program. Please send us feedback.

Just because you can find the names of some books by using google, doesn't mean you have ever read them, or understood them. I have copies of all three volumes of "Internetworking with TCP/IP- Client -Server Programming and Applications" by Douglas E. Comer, and David L. Stevens, Prentice Hall on my book shelf. (pick a page, any page, and I'll give you a quotation from it.)

If you note the copyright date of this series, you will see 1993. A mere 20 years after I started working with GE's world wide networks... top posting my email on model 33 teletypes with bell 103 modems.

>
> The claim about slow speeds on ARPANET and Usenet is quite stupid.

Really? Well, I suppose you think that everyone had 56K connections back in the '70's. I worked in the Electrical Engineering department at the University of Maryland, back then, and we were pretty proud of our first 9600 baud connection between the PDP11's, and the Univac's that had the darpa connection. It wasn't until we got a VAX 11/780 that we got a 56K pipe to the Univac's that connected to the darpanet. That was around 1980. I think diapers were you most prominent media for communication back then.

> ARPANET and Usenet did not exist at the same time. ARPANET didn't use
> TCP/IP protocol, and it gave way to what is now called the Internet
> when TCP/IP became the standard packet delivery protocol.

Prior to usenet, a variation on email, we were using email broadcast lists. The same top posting rules applied.

Usenet came into being while I was in graduate school, around 1980-83. I remember there was quite a buzz at that time. Decwriters were 300 baud, and the most common affortable modems were still using the Bell 103 standard

from the late '50s. 1200 baud modems were used for expensive applications, usually computer to computer data transfer. The 1200 baud modem didn't come into general use until DC Hayes produced an inexpensive model around 1983. It was a real screamer compared to the Bell 103's.

Shortly
> after that, the message posting system called Usenet was formalized to

>
> Enough said. Conversation ended. You don't seem to be worth any
> followup messages until you do some additional reading.

I don't need to read about it, I was there doing it. My first exposure to a world wide network was GE's back around 1970. It was the first commercial use of a global network. The normal terminal to connect to that net was a Model 33 Teletype, with a bell 103 modem. I bet you think they used Windows based PC's with 56K modems, and Netscape.

There are several solutions that work on urine smell available at pet
stores. One of them is called Out. There are others, as well. They are
non-reactive to the ammonia component and work biologically through enzyme
action. I haven't tried it on any boatanchors, but it works good enough so
that a dog can't smell where he's peed before.
If you ask me, thats pretty damn good!

Another hobby I have been into is restoring and collecting pinball
machines. I picked up an old machine a couple of winters ago that sat
in a barn for years. Brought it home and cleaned out the rats nests
and left in the garage. Summer hit and the rat piss that had soaked
into the wood stunk BIG time. Used javex to try to disinfect but no
match for the smell.

Sold it to a guy who has posted in this group. He said it eventually
faded but...

I won't buy anything in the winter that is wood that has had a nest in
it.

Hi,

One of the fellows who frequents this newsgroup
is auctioning a set of Hi-Z phones right now:
> http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=220032848391&ssPageName=STRK:MESE:IT&ih=012

That _is_ pretty damn good! Another product is Urine-Off, not to be confused
with Piss-Off. : <) Works well on pet urine, can't vouch for
effectiveness in radio chassis. I have always used Bam! spray cleaner on
tobacco smell problem units. (jukes and pins) Gotta keep it away from relays
and tube sockets, as it is conductive as hell, but it takes away the tar and
the stuff that makes the stink. It also rinses clean with plain water.
regards,
tom

I have for auction a Heathkit HP-23C power supply. I do not have an older radio that can make use of this power supply so on the auction block it goes.

I have replaced the +HV section capacitors with brand new ones. Visit my auction for pics and description, search for item 290037755013 or follow the link.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&ih=019&item=290037755013

rkling at comcast.net if you have any questions.

Hello John. I'm KB9RQZ, and I just love CW. We need to bring back code
testing for Techs. 13 wpm should work fine, Then we can keep the
riff-raff off the repeaters and end all the bogus moon bounce contacts.

I've been burned by bogus EME contacts, but I'm a retard.

Thanks for the tip Ed. Have down loaded schematic for Eldico rig to see how it was done. In Europe this tube was used in a Fish Phone rig (2-4MHz) made by Salor Radio of Denmark. I know it can be done, but with four tubes in parallel ? Best 73

[snip]

If your capacitors are anything like the oil-filled Sprague Black Beauties, I'd replace all of them on sight. It might just be my bad luck, but the oil-filled Black Beauties seem to short even harder than the wax paper caps. However, if the later paper-mylar Black Beauties are like the early series of paper-mylar Orange Drops, they should hold up well.

I think the all the oil-filled Black Beauties had one of the wires soldered into a ferrule and the paper-mylar Black Beauties had both of the leads come out in the standard way.

The paper-mylar Black Beauties seem much less common than the older oil filled Black Beauties. As far as I know, paper-mylar was around only in the late 50s to the late 60s.

I'll second what Frank suggests about replacing ALL of the black
beauty caps. I'm doing that now on the SP-600 I'm restoring.
While none were a dead short, most showed some leakage,
about 100K ohms. In many circuits, that won't cause a problem
but in some its a big deal. About 1/3 had cracked cases.

Steve

Two things make the Sprague Black Beauty caps a problem,
and both relate to their losing oil.

The cap is molded out of a black plastic, with a small
brass filler tube on the banded end. The capacitors were
filled with mineral oil through this tube, and the lead was
placed in the hole, and crimped. They then sealed the capacitor
by adding a little bit of solder.

So far, so good. Well, when the capacitors are installed, very
often the banded lead is close to the lug that is being soldered,
and it will carry the heat to the solder seal, and to the oil in
the cap. The slight pressure increase in the cap will softly
blow the solder out of the seal joint, and the oil will begin to
seep out of the capacitor. Note: the oil is the dielectric, not the
paper.

Also, most all plastics will shrink over time, and the plastic the
Black Beauties are made from is no exception. When it shrinks, the
leads, and the filler tube do not, and you get a small crack, and a
leak.

If the oil is allowed to seep out, and the moisture is allowed to
seep in, the capacitor will be compromised and become leaky. Also,
without the oil, the WV of the capacitor is lowered, because the oil
is the dielectric. Capacitors that are used near their WV will often
arc over, and become shorted.... with catastrophic results for the
rest of the circuit.

Ditto on the Black Beauties, especially the ones with the little brass tube, they seem to leak like crazy. More on the average than wax capacitors many decades older.

Also bad news are those pea-green molded caps with the color bands. Many Trans-Oceanics have around two dozen of those, all leaky.

I havent seen any major problem with postage-stamp or dipped silver-micas, maybe it was just one manufacturer's kind that is getting flaky? There is the problem of the silver migrating on silver-micas with considerable DC voltage across them.

There is one variety of capacitor that looks like the silver mica
"postage stamp" type of capacitor with all of the dots, but isn't
a mica at all. It is just a paper capacitor. They are usually
dark brown in color, and fail at about the same rate as normal wax/paper
capacitors.

Kill 'em all. They are junk by now, just like earlier wax/paper caps, for any serious application.

It takes less time to simply replace one than it does to pull it out, test it, and either re-install it or replace it.

You won't regret it, and you have nothing to lose. Unless you're one of those vintage electric guitar nitwits who wants to find an original "bumblebee" cap or two to provide that tasty "period" sound (i.e., distortion resulting from badly leaking capacitors, which certainly wasn't what the guitar sounded like when new).

Thanks for all who replied nice suggestions. It was a mix of weak tubes, mis allignment, a broken 800 vdc final connection, and a bad vfo transistor. Most problematic fault was a bad driver tube bad as in missing all together. This kept the coils from being aligned properly. Once I replaced the driver most all came into line. Now I can transceive on 75 meters. The other bands still need some work. Not bad for 25 bucs.

Don't let the "mica" caps fool ya. I chased an AGC problem for two days before I found a bad "mica" buried in an IF can. That was the straw that broke the camels back. I then replaced ALL micas along with every bumble bee, which, by the way, were all cracked.

All the crotchety old farts are either off somewhere beep-beep-beeping
away on CW or bitching to each other on the lower half of the 80m phone
band, so it's easy to avoid them and talk to someone who enjoys ham
radio as it is instead of whining about how it was.

Well, your milage may vary. I've clipped out at least a thousand old wax caps, two hundred plus plastic tubulars, and lesse, three discrete mica caps, and around eight of those wafer mica caps built into IF can bases.

Mica's can go bad, they just don't seem to do so very often IMHE.

I had to change 100% of the micas from a BC-669D. Also, micas in some ART-13s have also gone bad, some near impossible to get to. I don't think many of these components were ever even dreamed of to go this long! On the other hand, my SX-28, apparently in use almost continuously since is was purchased, is still humming (no pun intended!!). Hope I can get away with not doing the RF section...? Worst B/Bs I ever saw were in a National NC-125. They looked like they just dropped out of a bag of spoiled mussels.

I just attend hamfests and look in the boxes BELOW the tables for
the dirtiest crappy-looking headphones, and they are invariably
high impedance; I've acquired several that way, and they are
usually almost free!

But you do have to watch out for low-impedance headphones in the
same box; just take a VOM/DVM along for a quick test.

Most probably http://www.smallparts.com

They have nylon and steel chain, they might have what you need.

I found a supplier for the exact chain; it's not smallparts.com, and the
catalog's at work. I'll follow up tomorrow from there.

If a 12 year old can learn it I don't consider it much of a technical
skill. Nothing at all technical about CW. Building a transmitter, now
that takes somw technical know how.

3931. Fall Swap Meet Saturday Oct. 21st

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-10-11 10:39:47 UTC
From: Ron in Radio Heaven <kc4yoy@NOSPAM.carolina.rr.com>
Message-ID: <TR3Xg.19452$fy.277@tornado.southeast.rr.com>
Source record: 10581

It's just a little over a week away on Saturday Oct. 21st,
the CC-AWA's Fall Swap Meet at City Lake Park
in Jamestown/Greensboro NC.

Our Fall Swap Meet is always our biggest, it
was also our first "mini meet" when the former
VRUS (Virus) club folded and the guys running
the Greensboro Meet joined our club.

City Lake Park is a great site, with a good parking lots
and a gym if the weather should require that we move
inside.

Folks start showing up at around 7AM and things
are going wide open by 8AM.
As with most mini meets, when the vendors start
selling out, they pack up and go home.
DON'T SLEEP IN.
If you wait till 10AM to show up, you'll be disappointed.
By 11AM most are already gone or are packing and
making plans for lunch.

Admission is FREE, vendors only pay $5.

You can find updated driving directions at the
meets web page here, http://cc_awa.homestead.com/Fall.html

Brad Jones is meet Chairman and does a GREAT job.

Hope to see everyone there.

Ron Lawrence, CC-AWA President

3932. FA: HAMMARLUND SP-400 Receiver

> I found a supplier for the exact chain; it's not smallparts.com, and the
> catalog's at work. I'll follow up tomorrow from there.

It's carried by Stock Drive Products (www.sdp-si.com) as "miniature
roller chains - .1475 pitch", in their handbook 790-2: "inch drive
components". It comes in various lengths, from 50 through 240 links in
steps of 10 links. There's also a connecting link and a bushing link.
Each chain comes with one connecting link.

It's _very_ pricey, but for the R-1051, nothing but .1475" pitch will
do, and the nylon stuff just doesn't stand up to the strain.

E-mail is support@sdp-si.com, phone is 516-328-3300, and fax is
516-326-8827.

Good luck & 73, de

It sounds like you run a lot of 11m, not surprising considering how much
you whine, and it's not alternator whine.

3936. RF Can mystery solved.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-10-11 22:12:29 UTC
From: novatech@eskimo.com
Message-ID: <egjq8dglh1@eskinews.eskimo.com>
Source record: 10586

Back in 2001, I posted this:

novat...@eskimo.com (Steven Swift) writes:
>I have an RF "can" from a military radio which I would like to identify
>so I can use it for trading.

Several people have suggested Navy RB* radios. This thing has a grid cap
and the Navy Radios have single ended tubes. The Bendix MN-26 was also
suggested-- still looking for pictures/docs on that to check. Stamped
in the aluminum is a small square with SC in it (in the C22 adjust hole).
I think that means "Signal Corps."

Thanks for looking. I am still curious.

>Take a look at:
>http://novatech-instr.com/Ebay_Images/rfcan1.jpg
>and
>http://novatech-instr.com/Ebay_Images/rfcan2.jpg
>Tell me if you recognize it. This is not a "for sale" item.
>Some information:
>4 adjustable caps. The cover plate slides to give access
>4 adjustable coils, opposited side from caps
>Grid cap on top.
>Hole for pass through selector shaft.
>5 ceramic pass through solder terminals on the back.

Today, I noticed this item on Ebay: Item number: 160037504145

If you look at the images in my links and the top photo here, you will
see that what I have is the RF stage for the WWII Bendix RA-10
direction finder.

Steve.

3937. Identify mystery transmitter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-10-11 22:20:06 UTC
From: kc0atc@qsl.net
Message-ID: <1160605206.858124.219620@m73g2000cwd.googlegroups.com>
Source record: 10587

I've run these pictures past a few people, and no one has been
able to tell me what this thing is.

It is modified, probably to use on a ham band. But I would
like to know what it was originally. It looks like it has three
stages of frequency multiplication... so maybe it was VHF or something?

front:
http://www.yipyap.com/radio_stuff/xmitter1.jpg

front with doors open which give access to tube bases, fuses, etc:
http://www.yipyap.com/radio_stuff/xmitter3.jpg

Dimensions are roughly 4ft high, 3 ft wide and 18 inches deep.
(I've got it out back if someone wants me to go look for something.)

Any guesses?

Chris

A lot of ham rigs had three doubler stages, which could be bypassed if
desired. This meant you could use a single set of crystals on 160, 80, and
40M. Slick, huh?

I'll ask Ted, W3PWW. There was one of these for sale in PA a while
back. They came in 3 sections and were in footlocker-like containers.
Something like the GO-9, but taller. Stby one......

Well if it's not a problem to learn, let's keep the requirement and raise
it to 13WPM. It's a bit boring doing code at 5 words per minute, and at
13 WPM you can copy someones call for help almost three times as fast.

While you are being all holier than thou, what did you design and build for your main rig? I'm hoping to be impressed, but expecting to be disappointed.

Did the code help you with the design?

I took my Advanced class test down at 1919 M street 36 years ago. I had to sit at the desk and copy one solid minute out of five error free at 13WPM. I passed it on the first try. I almost failed the sending test, as I had never spent much time doing that. I had never made a code contact before my test, and I have only made a couple since.

The thing about code contacts is they never seem to want to say anything beyond:

WA3XXX DE W6XX RST 5NN WX FB 73 W6XX SK

How does that help the cause of amateur radio?

I have designed and built numerous rf receivers and transmitters, many are employed by the US Army for various uses. I have fixed many different radios from tube stuff through DSP driven affairs.

How exactly did the code help me to do this?

For me code was a means to an end. I wanted my license, so I learned the code.

There were plenty of rude, profane, and generally unpleasant hams on the air back when all had to pass the test in the offices of the FCC. I haven't noticed that things are any worse now. About the only real difference is in the quality of the gear folks are running. It is much better than the crappy stuff that was on the air back in the early 70's.

Name one real/valid/probable scenario for this. Let me guess, you crash land on the moon, have only a D-cell battery, some wire, a butter knife, happen to find some crystals, some silicon, somehow beyond your knowledge or abilities, manage to build a transmitter, and send your SOS back to Earth. Is that about right? Nah, you'd die trying to make it iambic.

Apparently, Rep. Mark Foley is homosexual. And like many homosexual men, he likes young teen boys. We should pray for him that he gets a handle on this problem and refrains from harming any more kids.

Meanwhile, we need to wake up. The fact that this is typical behavior for homosexuals doesn't stop us from continuing to elevate such folks to positions where they gain access to our kids.

Well, I've replaced 4 in my JX-17. That does seem unusual
but I think they suffer from the same problem other molded
type do, namely shrinkage of the case. These do not get
leaky like the BB's but become very unstable.

Burried in the TM 11-851 handbook (p.35 I think) and in
some Hammarlund advertising, I found a spec of 0.25% for
dial accuracy. This isn't too bad for a conventional
receiver. Also, I suspect the thing is capable of much
better adjustment than this. My experiments will have to
await getting over a back problem.

The BB's I found in the SP-600 are all of the dry Mylar type. I have seen BB's with oil all over them in other equipment. These were sold originally as highly stable, wide temperature range, replacements for the conventional paper type. Obviously something went wrong. The BB's I disected had glazed looking paper and attachment ferrules at the ends. They were not rolled up into a round tube but rather a quite flattened one. I don't know if this is how they were made or if its a result of the case shrinkage. In any case I agree with those who recommend replacing them at sight with disc ceramics.
BTW, Sangamo also sold Mylar-paper caps in Epoxy dipped form. I wonder if these were any more reliable than the molded ones.

I suspect the environment has something to do with it.
For instance, the BB's in my SP-600 were pretty awful but I
found one in a General Radio 1001A signal generatror that
looked brand new. I replaced it on general principles but it
tested good.

Top posting makes this very confusing.

However, I am convinced that nobody in industry or at the FCC cares about anything other than optimizing short-term revenue. The notion of optimizing spectrum use for the greatest good went out with the Carter administration. This is one of the greatest tragedies of our time in my opinion.

That's terrible logic.

You sound like you would be the sort of person people see along side a
highway with a flat tire and no spare.

That's pretty good. :-)

I know what you mean about the trolls Bill. I've decided to not follow-up to anything Markie Morgan, KB9RQZ posts anymore. Not that I ever remember seeing him posting anything that was worth a follow-up, but he's such a friggen retard that sometimes a person looses control and flames his dumb ass. I'm trying to watch out for that now. Thanks again for posting the cute sign. 73 How's your code practice coming along?

Are conversations on repeaters as technical as they were twenty-five years ago?

Me? I hear no-codes and nickle extras arguing how long a half wave dipole should be.

Oh, easily. 25 years ago, technical conversations were dominated by such earth shatteringly important stuff as having a ham down at the repeater site helping other hams tune their transmitters to be on frequency. Other wonderkind were hitting the repeater with a full quieting signal, and turning their power up to try and get a better signal to that DX mobile that breaking up.

If it wasn't that, it was an endless sea of autopatches calling the xyl to tell her that traffic was bad, could she start dinner... or ordering pizza.

>
> Me? I hear no-codes and nickle extras arguing how long a half wave dipole

I heard the same things 25 years ago from Generals that got their licenses at the offices of the FCC.

Even 34 years ago, there were study guides that had questions from the pool used by the FCC. If you could memorize the answers to those questions, you were virtually assured of passing. I used the ARRL handbook as my guide.

You didn't answer my questions about the home brew rig you are using.

This is NOT a Super-Pro 400, it is an earlier receiver,
looks like military surplus SP-200. The exact model depends
on the frequency range. The missing label on the front was
the military identifier. Three frequency ranges were offered
535KC to 20Mc (standard) 1250 KC to 40 Mc, and a version
covering 100kc to 400Kc on the two lower bands and 2.5 mc to
20Mc on the upper three. There is a fair amount of material
on the web which will alow identifying the particular model.
If the original bottom cover is present it may have a
schematic diagram pasted to the inside which will also
identify the model. A large number of these receivers were
built under contract by Howard Radio Co. The SP-200 series
was replace by the SP-400 in 1946. The SP-400 has continuous
coverage from 535Khz to 32Mhz. In addition, the band
indication is engraved or printed on the front panel rather
than on the skirt of the bandswitch knob. I wonder if the
power supply is around someplace. They are not impossible to
build but the original would be nice. Most military
receivers came with rack mount supplies.

The SP-400-X coverage was from 540 kc to 30 mc. The SP-400-SX covered
1250 kc to 40 mc. Those were the only two variants.

But, you are correct on the bandswitch and panel engravings.

Just wanted to set the record straight.

I had a SP-600-JX-14 several years ago that came from a Western
Electric monitoring station on the east coast. It came with a SPC-10
and a speaker panel. I had been on continuously for 24/7 for many, many
years other than for retubing and check-ups. It had "ALL" the original
black tubulars. None were split nor leaky. I used it for a couple more
years then sold it. I have had twenty SP-600's pass through my hands
over the years, most of those black tubulars or gray ones were leaky
and/or split open. The enviroment in which it was in and either in use
or sitting turned off would also make a difference.

In recent years the silver micas are now showing up bad, probably due
to silver migration. The avc chain on the SP-600's at this point in
time should be looked at closely. Many of them are bad.

YMMV

This here no-code would say that a half-wave dipole ought to be...
...as long as it needs to be, and no longer. Which brings up a
question: Does it make a difference what type of conductor is used to
build an antenna?, i.e. is copper 'better' than aluminum? are there
alloys whichare better still? how about conductive plastics?

And shape: all I've read about (so far) has been wire- or
rod-construction: dipole, inverted-V, quad, et cetera. How about
non-round elements like ribbon? They'd be collapsible rather than
bulky, since they could be wound up on a spool or bobbin.

Sort-of like the 'fishing-pole' antennas I've heard about, but with
more tensile strength, the idea being that the antenna could be
customized for whatever band you want to listen or transmit on (not a
new idea, granted); half-, third-, fifth-, quarter-, eighth-, you
pickit.
(hey, no sixth-wave antennas out there?)

Just curious. I've yet to learn enough about stuff to know what most
of you guys have probably forgotten long ago.

Thanks & 73, Terry KC9KEL

The SP-400-X coverage was from 540 kc to 30 mc. The
SP-400-SX covered
1250 kc to 40 mc. Those were the only two variants.

But, you are correct on the bandswitch and panel engravings.

Just wanted to set the record straight.

H. State

I've never seen an SP-400-SX, there certainly was an
SP-200 with this coverage. It differed from the others in
having shunt-fed RF plate coils rather than series fed. This
resulted in somewhat sharper tuning of the RF stages and
lower image response. I am not sure if the same arrangement
was used for either SP-400 models. These are still very
respectable receivers.

I am looking for a handbook for a Measurements Corporation
111-B Crystal Calibrator. I have one which needs some
trouble shooting and probably tuning. I can't find anything
on the usual web sites with old handbooks. A clear copy
would be fine, I don't need an original.

There's a 400-SX on ebay right now. As a major Hammarlund fan, I'm
tempted, but only mildly. It's been considerably modified, and by the
time packing fees and shipping are added to the BIN figure or something
close to it, we're in SP-600 territory. It's at
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&ih=016&item=260039592372&rd=1&sspagename=STRK%3AMEWA%3AIT&rd=1.

• 2.815 External radio frequency power amplifiers.

* * * * *

(b) No person shall manufacture, sell or lease, offer for sale or lease (including advertising for sale or lease) or import, ship or distribute for the purpose of selling or leasing or offering for sale or lease, any external radio frequency power amplifier capable of operation on any frequency or frequencies below 144 MHz unless the amplifier has received a grant of certification in accordance with subpart J of this part and other relevant parts of this chapter. These amplifiers shall comply with the following:

(1) The external radio frequency power amplifier shall not be capable of amplification in the frequency band 26-28 MHz.

(2) The amplifier shall not be capable of easy modification to permit its use as an amplifier in the frequency band 26-28 MHz.

(3) No more than 10 external radio frequency power amplifiers may be constructed for evaluation purposes in preparation for the submission of an

application for a grant of certification.

(4) If the external radio frequency power amplifier is intended for operation in the Amateur Radio Service under Part 97 of this Part, the requirements of Sections 97.315 and 97.317 of this chapter shall be met.

I am also skeptical about home made modifications. Its
easy to get the AVC unbalanced and create other problems.
My BC-779, bought surplus some 40 years ago, was heavily
modified to follow circuits published in CQ magazine. After
experimenting with these and my own modifications I restored
the original circuits and found they performed just about as
well, plus I eliminated some circuit loading of the RF tuned
circuits. The original uses what today would be considered
quite noisy tubes but one must take into account the
naturally occuring noise in the HF communication bands. Its
quite high so often a front end which is very quiet does not
buy much. Better to have one which can take overload. The
one worthwhile modification I've found for the SP-200 series
is the use of regulated voltage on the local oscillator and
mixer screen. This eliminates the frequency variation when

the RF gain changes.

And how much rf is max rf?

If you are getting 100W with no plate current indicated on the meters, then
you have a problem. If you are getting 10W maximum, with no plate current on the
meters, you need new tubes.

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Probably a long shot, but if anyone is interested in swapping
my Drake T4-X for your Halli SX-117, please contact me
directly.

The Drake comes with the power supply/speaker (MX-5?).
It is being offered as found, and will almost certainly need
to be re-capped. Front panel cosmetics are good. The radio
will need a good cleaning....lots of dust on the top of
the chassis. The cabinet top shows wear and will need
to be repainted to be nice. Under the chassis, its pristene
and not modified or hacked in any way.

Looking for an SX-117 in good to excellent cosmetic
condition. Must be complete and restorable to original
operating condition with NO hacks.

If interested, contact me soon. Once I start working on
the Drake I'll probably keep it and look for an R4.

Steve

Our reaction apparently was universal. The highest of three bids was a
little over $27. Needless to say, that did not meet the reserve.

Try asking on the Test-Equipment list, which is hosted by qth.net. See
<http://www.qth.net> for a list of mailing lists, and subscribe (or
not) as you please. The Test-Equipment list is low-activity, but very
much on-topic, and lits of folks have lots of obscure stuff that they
will scan-and-mail for you.

I'm not against choice. They can choose to be a ham, or they can choose
to be a CB'er. What they have to decide is how bad do they want to be a
ham. I enjoy hams on the bands, if I didn't, I'd buy a CB.

SC, tell us all, and don't lie. Do you not agree that a LOT of hams today were CB'ers in the '70's and chose to advance their radio skills by advancing to ham radio? If you disagree, then 1) you're a liar, and 2) did this not help the service? And thusly, if you disagree I suspect you fit into this mold, and choose to deny your past.

Dear Slow, I'm a new ham. I passed my Novice Exams in November of 1986, so in Ham Years, I'm a new ham.

What do I like best about appliance operating? I like the features and the ease of cleanup. The new GE range we have allows me to scroll up to the desired operating temperature, and push the "ON" button. Then "Pre" is shown on the temp readout until the oven comes up to temperature. And the smooth glass stove top is a snap to cleanup. If something should boil over, you don't have to lift up the burners and take the spill pans out, etc. Just a quick wipe with a damp dish cloth. It doesn't get much better than that.

Thanks for asking.

I have an extra HQ-160 in surprisingly very nice physical condition. It
does, however, have very low sens on the upper bands and I will not be
putting any more time into it. Book included.
Pick up in MD/DC/VA area and a bargain at $125.00

When you passed the FCC exam - you are an Amateur Radio Operator period -- plain and simple.

Whether you passed a 20 wpm code test or no code - you are a Ham

Whether you had to draw the schematic for a Colpitts Oscillator or not - you are a Ham

Whether you faced the steely-eyed FCC examiner or a VE -- you are a Ham

Those who say otherwise are shrouded in elitism and a synonym for elitism is snobbery - plain and simple

This is 2006, not 1920

Source record: 10469

I have a very clean and nice TBY-7 transmitter-receiver. It has the instruction book mounted to the top and the spare tubes are intact, inside. The chassis is pristine as is the front panel, tuning dials, and the canvas hold-down straps. Included also is a mating battery plug and 2 plug inserts for the headset and key. I'll also provide a copy of the conversion manual info, if desired. $100 plus shipping.

I also have a nice GRR-5 receiver in full working order. Includes the power cable, headset, original manual, whip antennae, and canvas cover. Selenium rectifiers replaced with 1N4005's. The spare parts case, with tubes, is also included. Pick-up only, no shipping.

Working DY-88/GRC-9 6/12/24v power supply. $100.00 Pick-up only.

Extremely clean and excellent (9.75) condition Hallicrafters S-39 Sky Ranger. Power supply has been re-capped and includes an isolation xformer tucked inside the battery box w/ no holes drilled. Only mod is power switch wiring (2 conductors) extended to iso xformer. $210.00, plus shipping.

Complete, new, Chinese 102E HF field radio set, including the hand-crank generator. I bought several of these from RedStar and am selling one system. This pair has been amateur band aligned and on-air tested, per my ER article. No modifications have been performed on these particular units, however. Provided also is the complete canvas suite, spare tubes, mic, headset, key, power cable, nicely re-done English manual set, and antenna and counterpoise. $300, pick-up only. (I should point out that, if you're interested, RedStar still sells these sets, although now minus the generator and power cable. The current cost is $200, plus $100 in shipping from Canada. One would need to weigh the options.)

JPEGs can be arranged for the above units. I can bring the above to the Westminster MD Hamfest, the end of this month.

BOTH are important.

If you're not running a homebrew or at least home-assembled rig, who
are you to call someone else an appliance operator?

What good are technical *discussions* if they don't translate into
actual working radio systems?

I have listened to hundreds of CW contacts, and the above is mostly the norm.
I exaggerate a bit, but it is rare that anyone talks about anything other
than a few very simple things. I have yet to listen to a complex conversation
on CW... The most complicated thing I have heard is W1AW code practice, and
some of the traffic nets.

>

Well, you wouldn't if you spent all of your time on CW. Things are very
polite on those subbands. If however, you ever listened to 20 meters
around 14.313, you might have a different idea of what ham radio was about.
For some reason that frequency was full of profane garbage mouthed hams,
and lots of infighting in the '70s and '80s.

>
>>>>> I haven't noticed that things are any worse now. About the only real

Perhaps, but nothing like some of the very cheap sweep tube transceivers of
the late 1960's, and early '70's. Swans that drifted furiously, and practically
invented the term TVI...

What are the bad HF SSB rigs of today? I would bet that even the absolute
worst is cleaner than anything that was available in the '60's, and '70's...
If only because the regulations got tighter on spurious emissions from new
gear.

...

>
> Do you mean the License Manual?

Nope, I did my Advanced from basic principles. I used the ARRL Radio
Amateur's Handbook as my guide to rules and regulations. The technical
side of my studying came from the handbook, and a variety of other radio
and engineering sources.

>
> It did not have the exact questions and answers in it.

I looked at friend's copy of one of the the license manuals that was available
after my test, and the questions and answers were very close. It was nothing
like the manuals that are available today, but still so close as to be a cheat.

Listening is one thing, participating is another. I've had many, many
CW QSOs that were far more complex than your example. Discussions of
rigs, antennas, jobs, family, plans for the near future (vacation, home
improvement, etc.), experiences in the other's location, and much more.

The stereotypical hello/goodbye QSO is usually the result of these
factors: poor conditions, unskilled operator(s), nature of the QSO (DX,
contest, just checking a new rig)

Of course somebody has to initiate - to say something beyond hello...

Well, I don't know about you. But for me, knowing Morse Code meant I
could build and use simple(r) radio systems to try out an idea.

If someone who isn't a trained electronics person wants to design and
build their amateur radio station, what sort of project should they
build? A complete multiband SSB transceiver? Or a simple CW rig?

Sure. But how many hams were involved, out of the hundreds of thousands
on the air?

> >>>>> I haven't noticed that things are any worse now. About the only real

Sure - but remember that those rigs were designed 40+ years ago. They
should be judged by the standards of their time.
>

> What are the bad HF SSB rigs of today? I would bet that even the absolute
> worst is cleaner than anything that was available in the '60's, and '70's...

It depends on what you consider "bad". Last FD we had some rigs that
were unusable because they put out wideband phase noise that messed up
stations on adjacent bands! Those rigs might have met the letter of the
law when new, but they sure made a lot of hash in the real world.

OTOH, serviceability of many ham rigs is very low. Even if you can deal
with SMT, a lot of them use house-numbered parts that become unobtanium
in a few years.

Same here - all the way to Extra in 1970.

> > It did not have the exact questions and answers in it.
>
> I looked at friend's copy of one of the the license manuals that was available
> after my test, and the questions and answers were very close. It was nothing
> like the manuals that are available today, but still so close as to be a cheat.

There were a couple of different license manuals available back then.

The ARRL LM was a reprint of FCC's study guide. Those FCC study guides
were produced by FCC to indicate the areas of knowledge you needed to
have for the test. They were essay format even though the tests were
multiple-choice.

AMECO and others rewrote them into multiple choice format.

A fellow named Dick Bash stationed himself outside FCC offices and
bought information from people who had just taken the tests. He was
able to recreate a pretty close version of the actual test by that
method. FCC decided not to prosecute him even though he published books
that were very close to the actual tests.

Then it all became academic with the VE system.

Exactly. *You* are not an appliance operator - nor are you calling
anybody else an appliance operator.

> Slow Code
> is the one complaining about appliance operators, of which it appears
> he is one.

Exactly. I didn't mean to imply that *you* were an appliance operator,
Chuck. Just that if "Slow Code" is going to call other people names, he
should be ready to back up his claims with actions. So far, we see
nothing.

Of course, one should not take "Slow Code" too seriously - if at all.

Kenwood TS-820S. I got a good deal because it had a few bugs. I spent
some of the evenings between the exam session and my ticket arriving
(that would be my GENERAL ticket, I skipped Novice and Technician) going
through it cleaning switches, adding ground straps to a couple circuit
boards and adding 17m to the 'AUX' position on the band switch. By the
time my ticket arrived in the mail it was ready. I worked Clipperton
Island the second day I was on the air and didn't realize it was quite
the DX catch until months later.

So, after your license came in the mail what did you start weenie whining about first?

To promote the mode, sure, but to require it no. I could make the same claim about RTTY, and Slow Scan. When they were popular, folks on those modes were all as polite as could be.

The impolite behavior seems to center around SSB. Probably because the mode requires essentially no effort.

It only takes a few. As I remember from those SSB wars in the '70's and '80's, a several hams were prosecuted. They were all General Class or higher. And because of the time frame, in which they were licensed, they had passed the CW hurdle. I recall that playing with their keyers on the SSB segment was part of their hijinks. A whole lot of "FU" and other acronyms were mixed in with the echo boxes, and microphone raking.

Fortunately, that wideband phase noise doesn't carry beyond a few hundred
yards from the radio. It used to be a really big problem with the early
solid state radios... But not so much so with the newer rigs. Field Day was
where I first noticed the effect.... Key the mike, and all bands were awash
in hiss, even before the first word was spoken. Icom comes to mind.
Having a Clegg FM27B around on field day is a real treat too...not!

Entirely the result of meeting the customer's demands for in expensive
feature laden radios that fit in packages smaller than a dictionary.

I don't think Bash was doing that until after the VE system came on line...
but I don't recall for sure.

...

Actually, these days for what little operating I do, I am an appliance
operator. Because of my early ham experience, and the fact that I am
an EE, I know how to design and build, even if I don't chose to do so
right now. Ham radio probably figures heavily in my being an EE.

My general belief is if you have passed the test that is in force, you
are a ham... period. Beyond passing whatever is required, I don't care
how you got here, just what you do now that you are here.

Yep, love them big ceramic switches. But a lot of what seems like
overkill was necessary, as the antennas were not too well matched,
leading to high SWR's, voltages and currents, there was lots of
condensation wuith the temperature changes, and sparks fly easier at
high altitudes.

Isnt there a small neutralizing variable capacitor in there with like
half-inch spacing of the plates?

Hi all: Over time I've come across some tubes & radios that are foreign to my particular areas of interest, do you permit FS posts here? Looking to get into good hands tubes & stuff I'll never use, without going the FleaBay route... Lots of transmitting type tubes and/or old radio, also some radios and ham xceivers, some unusual ones... my particular specialty is in the area of HiFi/Stereo and I'd like to unload this stuff to some appreciative hands.... thanks much, Roger

Bill,

I actually have the paragraph from page 63 in 200 Meters and Down copied and set in a frame with a picture once run in QST of G5BD, arm amputee, sending code while peddling a generator. The two snapshots from our past certainly capture the essence of what ham radio used to be. Sadly.

ZUT,

One way to promote a mode is to give it significant band space.

> I could make the same claim
> about RTTY, and Slow Scan. When they were popular, folks on those modes were
> all as polite as could be.

The difference is that only Morse Code requires skills that the average
person does not have.

> The impolite behavior seems to center around SSB. Probably because the mode
> requires essentially no effort.

Maybe. I think there are many causes.

> >> If however, you ever listened to 20 meters

They were a few out of hundreds of thousands.

And yes, they all passed the Morse Code test - supposedly, anyhow. But
they also passed one or more *written* tests which included questions
on acceptable on-air behavior. Why don't the written tests get the
blame?

Look at the recent case of Jack Gerritsen, ex-KG6IRO. What possible
reason is there for his behavior?

Are those really customer demands, or are they driven by the
manufacturers who want to sell more radios?

It was the other way around. Bash did his thing in the early 1970s. The
VE system came to be in the early 1980s. The VE system put Bash out of
business because the question pools became public then.

| Common name: Woodland Troll |
| Scientific name: Trollus Useneticus |

```
##################################################################
# #
# PHYSICAL CHARACTERISTICS: #
# #
# The common woodland troll (Trollus Useneticus) is an #
# approximately 1.7m long nocturnal furry creature that #
# has been found to exist in nearly every climate and #
# latitude. Predominant features include: a very pale #
# complexion, a large bony ridge above the eyes, a dense #
# cranium, dragging knuckles, and a pungent odor. #
# #
##################################################################

##################################################################
# #
# HABITAT: #
# #
# Most trolls spend the daylight hours under a large rock #
# sleeping. Unfortunately, the natural habitat of the #
# troll has been encroached by development (as is all too #
# common these days). The modern troll has to make due #
# with a slimy, moss covered rock. Often, trolls are #
# forced to endure poor sanitation and filthy living #
# conditions. Combined with the general lack of hygiene #
# among trolls, this results in a very unpleasant odor. #
# #
##################################################################

##################################################################
# #
# ACTIVITIES AND DIET: #
# #
# During their active period at night, the common troll #
# engages in numerous activities, though the most #
# important of these is foraging for food. The one #
# characteristic that ties all different troll species #
# and sub-species together is their diet. Trolls #
# invariably survive off of a combination of cheetos, #
# arguments, and annoying others. A typical troll #
# requires approximately 10 arguments and flames per day #
# just to stay alive. With the increasing use of #
# killfiles and just regular ignoring of trolls, it has #
# become more and more difficult for trolls to eke out a #
# basic sustenance. #
# #
##################################################################

##################################################################
# #
# KNOWN PREDATORS: #
# #
# Unfortunately, trolls have many predators. Most common #
```

```
# among them are the helpful researcher, the informative #
# poster, the cool headed responder, and the kill-filer. #
# The cool header responder is technically not a troll #
# predator however. Trolls are typically unfazed by #
# logical counter arguments and cool headed reason. #
# However, even though their posts do not deliver the #
# same level of sustenance that a "flamer" or an "annoyed #
# poster" may provide, they still provide a valuable #
# source of dietary fiber for the troll. #
# #
# The most dangerous predators for the trolls are the #
# helpful researcher, the informative poster, and the #
# kill-filer. The common troll is highly allergic to #
# fact, real data, and research. Upon skin contact with #
# actual hard evidence and real data, the troll will #
# experience intense itching and burning at the site of #
# contact, followed by lesions and blisters. Eventually, #
# this results in loss of skin near the area of contact, #
# and usually to loss of a limb (in the example of #
# contact near the arm or leg). Contact with facts and #
# data near the facial area usually results in a slow #
# painful death. Contact with extremely high doses of #
# fact and hard data can cause temporary loss of #
# consciousness and even permanent brain damage for the #
# troll. #
# #
# The kill-filer poses a much more insidious threat to #
# the troll. Not posing a direct threat to the troll per #
# se, the kill-filer simply deprives the troll of yet #
# another source of nourishment. Some trolls have #
# developed counter measures to thwart the kill-filers, #
# usually this takes the form of a type of camoflage. #
# #
# The trolls' predators have reaped a terrible slaughter #
# over the years, resulting in the death of great hordes #
# of trolls. Trolls continue to breed rapidly though and #
# their population is stable. However, it is unknown how #
# long this situation can persist. Eventually, natural #
# predators and poachers may result in lower numbers of #
# trolls. Already we are seeing lower diversity among #
# the different troll species. That is why this troll #
# habitat refuge exists, to ensure the preservation of #

I'm sure a lot of hams migrated from citizens band, but up until about the last 16 years, they had to pass a real ham test to get in. Not dumbed down tests like we have today.

I made a lot of contacts on CW. I knew it was what I had to do to be a valuable asset to the service and I had a lot of fun communicating with other CW ops around the world. I was always surprised at how good the Russians were at CW. Doing CW helped me get get my skills up and I quickly passed my 20 wpm Extra. (the real Extra)

Now I try to help other hams and potential hams on radio and on usenet, but the usenet hams are so lazy they don't want to learn anything. They want licensing to be dumbed down some more.

4046. HCRA Auction, November 3rd, Feeding Hills, MA

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-10-19 02:53:57 UTC
From: Charter Newsgroups <jmullen@rockys.com>

Source record: 10396

HCRA Annual Auction - Feeding Hills, MA - November 3rd

One of the Northeast's largest ham radio auctions is just around the corner. Mark November 3rd on your calendar now for the HCRA Annual Auction. Admission is FREE for both sellers & buyers!

The Hampden County Radio Assn. has been holding this auction for many years and it is consistently well attended. It's the perfect place for either buying or selling. Attendance is usually around the 100 mark, very closely a 50/50 split between buyers and sellers.

For sellers it offers a great way to unload some of that less desirable (i.e. non-eBay) gear quickly and easily. For buyers a fantastic opportunity to get some great bargains on both old and new gear, outfit the workshop or get some much needed parts at super prices.

Also, why not purchase a raffle ticket for an Icom IC-718DSP HF radio. For as little as a $1 donation (book of 6 for $5) you could be the lucky winner!

The details:

Date: November 3, 2006
Time: Set-up at 6:30 PM, auction starts at 7:30
Place: Feeding Hills Congregational Church
21 N. Westfield Street
Feeding Hills, MA 01030

The fine print:

If you are selling, please mark all items with your name, call (if any) and a minimum bid (if you so desire). The HCRA takes 10% of the sale, up to a maximum of $10, as a club donation. Please limit items to amateur radio or electronic equipment. If you have a lot of 'little' stuff it usually sells better as a 'combination' box. The auctioneers reserve the right to combine auction items to speed up the auction. If it doesn't sell you take it home!

Please, no computer monitors. Our experience is they don't sell and you end up taking them back with you.

More information can be found at: http://www.hcra.org/auction_2005.htm

Refreshments will be available, including coffee, soda and donuts - a ham radio treat!

Any questions, please give me a call.

'73... and see you at the auction!

4048. SP-600 tuning backlash....

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-10-20 01:35:00 UTC
From: Steve <zarco@sonic.net>
Message-ID: <453827ca$0$34498$742ec2ed@news.sonic.net>

A while back I posted about the 'SP-600 from hell'.
After a lot of work, and some great advice, the restoration
is complete. Still a couple of small bugs to work out.

One is bad backlash in the main tuning dial. This
radio uses gears that are mounted on movable plates
that are pre-loaded with an "S" shaped spring. I've made
certain that the plates are able to move freely, and the springs
are OK. Has anyone had, and solved this problem? If
so, I'd sure like to hear from you. At this point I'm stumped.

TIA

Steve
p.s.-still looking for the main tuning and crystal phasing knobs

Ahhhh, fond memories from my first "radio" related job. My boss asked me if I could reassemble a radio for a customer. It was an SP-600 in several milk crates with all the gears and hardware in a coffee can.

I'd have to say it's infinitly more "entertaining" to put the front panel of an SP-600 back toegther having NOT seen how it came apart.

If I remember correctly, the anti-backlash drive on that was a two-piece flat gear. (mounted back to back as one) with a spring to to provide the "anti-backlash".

The two gears are rotated against the spring and then engaged to the mating gear. The idea being that the spring forces the gear teeth to mate "perfectly" with the other gear.

You want the two gears to pinch the mating gear. I.e. close under spring tension. If it is twisted the other way, it tends to spread the gear, and results in horrible backlash.

Jeff,
Thats the way any normal radio deals with back lash.
Not the SP-600, at least not mine.

I'll bet putting that SP-600 back together took a while!
The only thing worse would be an R-390 basket case.
E-gad!

At our Sony factory service depot we once received a suit box from one
of the dealers. When we opened it we found two big slabs of foam rubber
taped into a sandwich. We opened the sandwich, and there was a camcorder
in a million pieces with a note attached. The note read 'It's all fixed
and ready for you to assemble'!!!!!!!

We frequently had people bring in 'equipment in a bag' and it always
seemed that 'Dad' tried to fix it, or if it was a man bringing it in,
he usually said his son tried to fix it.

Ah, the good old days. I presume the practice still continues.

Gosh, I've been 'in there' twice now and didn't notice a neutralizing condenser, and I have an ol' National Radio one that has about 1" disks, one on an adjustable screw, so I think I'd av noticed one. Yup, ur rite, this was meant to tune a trailing wire from an aircraft, or a generic mobile whip, so the SWR would have been often wild. All the more reason I'm after the 6 position switch for a three-holer 4-400 amp I'm working on YEE-HAW!

Now since this unit is absolutely SHINEY BRIGHT NOS, another member of this group has stepped up to the plate to get me to donate it to an antique aviation museum in return for the HD ceramic parts I so coveted in this beast, so that will probably be the final deal.

Another member of this list is in negotiation w/ me for an ol' Teletype Model 15 KSR I have, his 'list name' is 'Rice' - I've had bad times in the past in transfering my ol' goodies (an Hallisratchers BC-610 in excellent condition w/ all coils to a 'supposed museum', for example) that despite my 'handshake' agreement that it NOT be parted out, dissappeared forever, arrrgggh. Is this 'Rice' person legit here on the list?

I just took pictures of an ol' Airline Model SB 'B Power Supply' for eBay, along with one of my many bread-slicer variable caps, so gotta get over there and post 'em.

After about 40 years of hammin', I'm now having trouble even remembering where I got all the strange ol' stuff I've in my basement, but the OL sez we gotta get it cleaned out before I retire, so here we go (now to figure out what caps are sour in the ol' R-390eh).

G'nite and enjoy the stuff that glowz,

Mark KX8XX ...-.-

No you don't, you come here and grind your ax for some reason. You want to help? Be positive about ham radio, all of ham radio and not just the niche you want to inhabit. Open your eyes, see the whole hobby and realize those that don't share your tastes are just as competent or incompetent as you.

> but the usenet hams are so lazy they don't want to learn anything. They
> want licensing to be dumbed down some more.

Translation: They want to keep up with technology and eliminate testing on methods that are plainly antiquated and waning in usefulness and I don't want things to change so I don't lose my relative (perceived) status among hams.

I understand kids taking things apart. But it just amazes me when a grown men bring stuff to me to fix because I repair old equip and sometimes I have to say " Why in Gods name did you take apart that Swiss watch, handycam, etc..?" Then I have to tell them I can't fix it. I can't beleive the stuff some guys think they can fix with their handyman tool set. Are they that out of touch with reality and their own limitations? LOL!!! :)

Jeff,
Useful pics will be difficult. The front panel mechanical
stuff is in layers, and much of it is hidden. If I take the
front panel off (again....), I'll give it a shot.

Big grin And here we go, back to the original concept of
the front panel being removed and all the parts in a coffee
can.

Although, as an intermediate step, see if you can check the
anti-backlash gear and make sure it it sprung in the correct
direction to pinch, not spread against the mating gears.

Jeff

hi Steve,
I'm not sure if you mean backlash, or slippage. The SP-600 doesn't use the split gears mentioned by someone, as you know.
Are you sure you haven't lost the small ball bearing that is used at the front of the shaft in front of the main tuning cap, loaded by the adjustment just outside the steel plate? The tuning capacitor should have almost no friction, little force is normally needed to turn it, but if that ball is missing, you'll have lots of friction, and things will exhibit backlash.
If it's slippage, that more closely fits your description of moving plate, S-spring, etc. Is it at the brass "wheels" behind the main tuning knob? If they are bieng held in good contact my the spring, they must still be absolutely clean. No oil needs to be used on any of the gearing, it's brass and self lubricating. These 2 "wheels", the small one fits in a groove on the larger one, work by friction. If there's slippage, clean them scrupulously with alcohol and a very clean rag. Do not try any lubricants in that area, or try as some have, to use tape or rubber to make them sticky.
I have worked on well over a dozen SP-600's in the past few years, and never have had to do anything other than cleaning to eliminate slippage.
You might try looking at some of the SP-600 refurb/rebuilds that are well documented on The Hammarlund Historian website, <http://www.hammarlund.info> or at some of my own work shown on my own site, <http://www.boatanchors.org>
I know I've taken pix of the friction drive mechanism, but not sure I've gotten them posted on either site.
I hope one of these suggestions helps solve your problem. Let me know if I can help in any way.
(knobs are rarities, particularly the main tuning/bandchange ones, they get the skirts broken too easily).

Al,
My SP-600 has both problems....slippage AND backlash.
I did see how the brass on brass friction drive is done at the
tapered brass wheels and the dials. I tried everything to eliminate
the slippage, and was 95% succesful.

I've come to the conclusion that this radio has been used a LOT,
and is just showing signs of excessive wear. The front panel
had never been off, so I'm sure the bearing at the front of
the tuning cap is still there, but I'll bet its corroded to some
degree. Everything else on this radio was. I even replaced
most of the screws because they were so rusty. I'll pull out
the bearing tomorrow and take a look.

The tuning mechanism on the SP-600 is normally silky smooth,
and certainly one of the reasons I've always enjoyed using them
over the years.

Thanks very much for your note and suggestions!

Steve

Theo -

Did you even bother to contact the Ten-Tec UK offices?
http://www.aoruk.com/tentec/

TenTec DIRECT,
Unit 9, Dimple Road Business Centre,
Matlock, Derbyshire DE4 3JX
Tel: 01629 581222
Fax: 01629 580070
tentec@aoruk.com

TenTec has been around for quite some time, founded in the USA in 1968 many amateur radio and commercial products have been produced. More than ever leading edge technology (such as DSP) has been employed in the design and manufacture of amateur radio and commercial radio products produced by TenTec.

Despite being a technology leader in the U.S. our equipment is not as well known in the UK, this is about to change with the formation of a UK sales office, TenTec DIRECT, UK.

4071. Hallicrafters SX-28 swap

I have a very nice Hallicrafters SX-28 to swap for an entry level solid state HF transceiver (plus cash if necessary).

Radio worked well about 2 years ago when I used to listen to it, has been stored since - no 'issues' that I remember (not really a boatanchor person), cabinet and face look good.

Let me know if interested - unless you can pick up we'll have to talk about shipping charges - heavy radio.

John
St. Louis MO

There's a manual for the IM2410 counter here:
http://bama.edebris.com/manuals/heath/im2410/

It's probably worth a look.

I failed to mention that the IM-2400 is a handheld about the size of a large
TV remote. It looks like it may have had nicads in it they're missing and
all I see a red wire with no connector dangling, no ground but I think I
could use the grond of the PC board. So I need to know the voltage. BTW
the BAMA site has a desk model, AC powered.
tnx

Hi...

I have one... the back panel says:

(quote)

EIA-416

Five - 1.2v ni-cad batteries
(heath co. part no. 418-32)

CAUTION: operational hazard may exist
if any battery charger other than the model
specified in the manual is used

(end quote)

Take care.

Ken

From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <fw5%g.4870$uJ2.4600@dukeread03>
Source record: 10437

I have for sale the fellowing items from a couple of estates. Most of the gear has been stored for several years.
1. A nice TenTec Century/21 Transceiver. It works and looks almost new, but the PTO is stuck. Needs PTO servicing. It has been stored for over 10 years.
Receivers well; Full output. Price$145.
2. Atlas 210X nice shape, works. Price $175.
3. Azden PCS-4000 2 Meter Mobile Transceiver with mobile mount. Looks great, but needs work. No transmit. Has mic and manual. Price $40.
4. Tokyo Hy-Power UHF HT, Model HT-7, Micro FM Transceiver/Micro 7. NIB, but no batteries. $35.
5. Pace Communicator MX, 2 Meter HT with manual, needs batteries, $25.
6. Cushcraft Ringo Ranger II, Model ARX-2B, 2 Meter base antenna, $40.
All item plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

Message-ID: <HMa%g.15$yw3.12@newsfe03.lga>
Source record: 10438

I've got a SX-28 just sitting here, taking up room and collecting dust - I'm not into boatanchors. Worked very well the last time I played with it about 2 years ago, since then it's been stored in the closet.

Will trade for HF rig (I'll throw in cash) such as Yaesu 990, 920, 1000mp or Kenwood TS-570DG TS-870 or what have you - antennas - Yaesu FT-897d filters - etc...
If you don't need it, maybe I do - I certainly don't need the SX-28.

Let me know...

John

Another although unlikely possibility is that the clamp
for the bandspread dial, which drives the rest of the
mechinism, is not tight. The symptom is that the logging
dial turns but the main dial does not. That doesn't sound
like what you describe.
The times I've had slippage have all been caused by
residue of some sort on the edge of the logging dial and the
friction wheels which drive it, they must be absolutely
clean and dry.
I've also seen one case where the movement of the spring

loaded "spiders" was limited because of MFP compound, the
spiders must move very freely.
There is a pretty extensive handbook showing the gear
mechanism on the BAMA site. It should be absolutely buttery
smooth.

Hi everyone!
I'm new to the group and just retired. I'm looking for a Hammarlund Pro-310 receiver to possibly restore as a hobby. I have fond memories of this receiver from my high school days. Has anyone had experience restoring one of these? I cannot find much about this except that they appear to be rare. Also did the Pro-310 contain any black beauties or other paper caps?

I have for sale in very good condition a National NC-300 receiver. It comes with the original manual and from a non smoker and its working. All the tubes have been checked and I did replace a few that were a little weak using a TV-7D/U tube tester. The front face I would call excellent and if you need digital shots I have close up shots of the front face and all around the cabinet. This will be a pick up only and I'm located in Lakeville, Ma. 35 miles South Boston. I will take $250 and it sure is a collectors piece....If you have any questions you can call me at (508) 821-2993....WZ1U Steve...Check out this site it will give you all the info you need about the receiver....http://www.io.com/~nielw/nat_list/nc300.htm

325.00 plus shipping

4094. Re: Hammarlund Pro-310

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-10-25 02:00:01 UTC
From: David Thompson <thompson@mindspring.com>
Message-ID: <Byz%g.12488$Lv3.8706@newsread1.news.pas.earthlink.net>
Source record: 10344

After reading NQ5T's adventure in repairing the dial drives
I undersatnd why Frank Lester W2AMJ/W4AMJ called the PRO-310 Hammarlund's
great adventure. The Bandswitch mechanism cost hammarlund about $75.

Frank first task was to call sales manager Frank Sylvester who was at henry
radio getting an order for 100 sets. Frank put the receiver thru some tests
and did not like the performance especially of the IF's so he called
Sylvester back to give him time to figure out what was wrong. He said the
receiver was the gosh darndest thing to get into he had every seen. He
fixed the problem that was in the second IF stage and then completely
revamped the Rf. That the receiver met specs was due to the fast redo by
Frank and the young engineer who had designed the receiver. None of the
Engineers were hams so Frank made them get their tickets so they would see
designs in the way hams see them.

I enterviewed Frank in 1997 and he agrees with a statement made by NQ5T
about "lasting forever" never intended to be 50 years plus! Frank went on
to take over the Super Pro 600 fixes and notes (every goverment contract
wanted some different) and design the basic HC-10 which became the basis for
hammarlund receivers (60 kcs IF's and the Hammarlund patented slot filter)
for the next decade.

Frank became a slient key this Spring at the age of 97.

Lloyd Hammarlund pulled the plug on the PRO-310 after
only 600 units as the margin in the amateur radio market
was too small and no government contracts for the receiver were ever
received try as they might.

Just to find such a receiver in restorable shape is a miracle
Frank told me and this was in May 1997.

happy restoring!

Dave K4JRB

I am fascinated to hear some of the inside story of this
receiver. I remember when they came out, I drooled over one
at Henry Radio when I was about 14 or 15. However, I
remember they did not stir up much excitement at the time,
perhaps too much competition and too expensive. I don't
think I've seen one since.

Gary, There are probably a hundred or so of them on the air, currently. At times a half-dozen will show up on the East Coast "Old Military Radio Net" each Saturday morning on 3885 (0500-0700 E/EDST). W3PWW is the NCS. If you've been through the process already once, I won't bore you with some of the regular pitfalls, like the Surplus Conversion manual having incorrect power and metering connections. Good luck on your project and check in with us some Sat. morning at o-dark-thirty....

I'm doing some of my own mods such as adding a 50 watt 180 volt zener to the screens. Using the O-17/ART-13a low frequency oscillator for 160 meters and rerouting the the output back through the HF Pi network. The power supply is all solid state and is running 1500 volts to the 813. This gives about 110 watts out.

4111. National NC-120 manual

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-10-26 11:32:41 UTC
From: Don <c696@earthlink.net>
Message-ID: <1161862361.909685.151270@e3g2000cwe.googlegroups.com>
Source record: 10361

I am restoring a National NC-120 receiver. I understand this type was used by the US Navy during World War 2. I need a repair manual with test information such as tube socket voltages and a schematic with component values. One similar to the ones I have for my BC-348 R and Bendix RA-1B that has pictorial drawings of component placement and arrangement of wiring would be great. Also any advice from anyone with experience with this model will be appreciated. So far I have found the power supply voltage to be about 220 DC and all the tubes test OK, but some of the socket voltages seem wrong to me but I am not a radio tech. The radio was working and just faded out.

Thanks
Don VE1DLT

Don, The manual can be found on the BAMA website. I have overhauled two HQ-120's and found that, on both, 100% of the capacitors had to be replaced, along with a few resistors. I have to say that after the re-capping, they now function extremely well. The HQ-120 was used by the Navy as the RBG-2 and, generally, had a large metal tag or screened label with the Navy nomenclature on it. The Navy version also had some ruggedized transformers in them. I'll also add that the HQ-120, and most other equipment from this era, like to be run on 110v. At 120v or higher, they can run very hot and cause stress. I use a 15A Variac on my "vintage line voltage bus" to keep things cool and calm.
Good luck with your project.

But he's talking about a National NC-120, not a Hammarlund HQ-120. Maybe
he's mixed up about the receiver he has, but that seems a stretge.

I've got two, plus a set of the connectors, remote control box
and the LF osc, loading coil and other pieces. Had 3 in my life,
great radio. In fact, there's one cooking on just filaments
in the shop right now, just to dry it out.

Forgot to mention, the last one I had on the air was
all set up with grid block keying. The relays werent
fast enough to follow my bug too well......hee.

Works the same whether shiny or not. Besides, if you don't leave something easy for the new owner to do, it spoils all their fun :-)

I did a little web searching (always worth doing) and
found a page dedicated to this receiver at:
http://oak.cats.ohiou.edu/~postr/bapix/NC120RAO.htm

The site refers to the BAMA site and I was able to find a
handbook at:
http://oak.cats.ohiou.edu/~postr/bapix/NC120RAO.htm Listed
as the RAO, which was the Navy designation for this
receiver.
This, like much other material on the BAMA site is in the
form of a Dejavu document and needs Djvu to open. This is
available as freeware at http://windjview.sourceforge.net/
Unfortunately, the digital compression of this program is
such as to make schmatics a bit blury and hard to read.
The NC-120/RAO is essentially the same receiver as the
NC-100AX. There is also a handbook for this and for other
versions, I would get all because one or the other will
fill-in info missing from a particular one. Unfortunately,
the main NC-100/101 handbook is really a condensation of

material about 2 similar but not identical receivers. The NC-100 is the one with the large calibrated dial, the 101 was a ham band only receiver with a PW dial on it. There appear to have been a number of variations of the receiver, with different locations for some of the controls. The BAMA site also has a handbook for the NC-100ASD, essentially the same except for covering 100-400 Khz instead of the broadcast band.
Good luck with this thing, I haven't seen an NC-100 for quite some time but have always been intrigued by them. The later NC-200 and 2-40D were based on this basic design with more elaborate tuning arrangements.

Hello.............NG
I need advice on Identifying this tuning unit..?
Pix available...I was told it was Collins...? Not Sure..
Extremely well built...Very cool!..Doesn't look like it was ever used...
Several available...Very elaborate and complex
All help will be greatly appreciated..Thanks in advance..
Tons more Ham, Radio stuff available...From an estate...(Just beginning to
un-earth the contents..)
Feel free to contact me anytime..Phone or eMail...OK

Oh, really????
How about THIS one? (QRZ) and a newstory from England?

Quote
Morse code used in rescue!

London, 20 October/GNN/ -- MARITIME AND COASTGUARD AGENCY News Release (Press Notice: 368_06) issued by The Government News Network on 20 October 2006

Yesterday afternoon just after 5.30pm Hayling Island Coastguard team member, Steve Mann, witnessed what he thought was a SOS message flashed by torchlight towards the Control Tower at Hayling Island Sailing Club. Steve responded to the SOS message by switching the lights on and off in the Control Tower.

The casualty was identified and was indeed using Morse code as he had recently transferred all of his safety equipment from his 28ft fishing vessel onto a newly acquired boat. He was running this vessel from Emsworth to Thorneham Marina, a distance of about 4 miles, when he ran aground and started to take on water. Steve Mann then alerted Solent Coastguard Marine Rescue Coordination Centre who requested the launch of the RNLI inshore and D-class lifeboats from Hayling island to the casualty who was transferred to Hayling Island Lifeboat Station, where he was checked over by a crewman who is also a paramedic. His vessel was towed back to Sparks Marina by the inshore lifeboat.

Steve Mann said afterwards, "I was absolutely amazed to see the flashed SOS message. This man was caught out on the one occasion he went to sea with absolutely no safety equipment. Even without radio communication going to sea without even a portable flare is extremely dangerous and could cost you your life."

I would bet that the person flashing SOS knows little, or no morse code other
than SOS.

This, as an argument for hams using CW, is kind of like "mayday" being an
argument for hams being conversant in French.

-Chuck

Somewhere in the shipping sequence, the circular metallic knob insert for the VFO knob on my "new" HT-32A apparently got lost. Its the concave version, like on the SX-101. If anyone has a replacement for same, I'd like to know. Purchase it or trade for other vintage Hallicrafters, Hammarlund, or military knobs. Tnx. de K3HVG

Actually, I have held an advanced class ticket for more than 30 years.

I took my test at 1919 M Street, NW? Washington, DC. Under the watchful
eye of an FCC examiner. My code test came off of an old signal corps
paper tape driven code practice machine. The key they gave me to use was
from the same set.

My receiving speed was somewhere around 40wpm, and my sending sucks rope.
I never could master an Iambic keyer.

-Chuck

Thanks to everyone that responded to my request for information and manual sources. I think I now have what I need and look forward to overhauling the set this year.

4139. HCRA Auction, November 3rd, Feeding Hills, MA

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-10-28 13:30:54 UTC
From: "JIm, KK1W" <jmullen@rockys.com>
Message-ID: <qZI0h.83$Pf7.74@newsfe03.lga>
Source record: 10389

HCRA Annual Auction - Feeding Hills, MA - November 3rd - less than one week away!

One of the Northeast's largest ham radio auctions is just around the corner. Mark November 3rd on your calendar now for the HCRA Annual Auction. Admission is FREE for both sellers & buyers!

The Hampden County Radio Assn. has been holding this auction for many years and it is consistently well attended. It's the perfect place for either buying or selling. Attendance is usually around the 100 mark, very closely a 50/50 split between buyers and sellers.

For sellers it offers a great way to unload some of that less desirable (i.e. non-eBay) gear quickly and easily. For buyers a fantastic opportunity to get some great bargains on both old and new gear, outfit the workshop or get some much needed parts at super prices.

Also, why not purchase a raffle ticket for an Icom IC-718DSP HF radio. For as little as a $1 donation (book of 6 for $5) you could be the lucky winner!

The details:

Date: November 3, 2006
Time: Set-up at 6:30 PM, auction starts at 7:30
Place: Feeding Hills Congregational Church
21 N. Westfield Street
Feeding Hills, MA 01030

The fine print:

If you are selling, please mark all items with your name, call (if any) and a minimum bid (if you so desire). The HCRA takes 10% of the sale, up to a maximum of $10, as a club donation. Please limit items to amateur radio or electronic equipment. If you have a lot of 'little' stuff it usually sells better as a 'combination' box. The auctioneers reserve the right to combine auction items to speed up the auction. If it doesn't sell you take it home!

Please, no computer monitors. Our experience is they don't sell and you end up taking them back with you.

More information can be found at: http://www.hcra.org/auction_2005.htm

Refreshments will be available, including coffee, soda and donuts - a ham radio treat!

Any questions, please give me a call.

'73... and see you at the auction!

Jim, KK1W

Once you master the electronic key you'll wonder how you ever got by
without one. I used a straight key for years and then got an electronic
one. It made code more fun. I tried a bug once, but after using the
electronic key I lost my timing on the side to side stuff.

One thing for sure in the maritime story above, someone did know morse,
and the rescuers probably weren't going to wait for a full message after
the sos. they would start the rescue right away, they didn't need to see a
message.

Be-builders / repairs:
hate to throw away.....
Cleaning out estate stuff: for the widow.
Have a large wooden box full of bath tub caps: various sizes and voltages
from .5 to 5 @ 100v to 600v. Weight probably 20 lbs...yes, that many ! Cheap
plus ship cost. Box approx. 12 x 15.
Also some oil/pyranols: various sizes and voltages from 1-2-4 @ 200v to
2kv. Most new never used with hold-downs. Box size approx 1 foot
square.Weight 20 lbs
Offer for a handfull or ..... + ship cost to be determined.
New-unused boxed pair RCA 866A's. $15 + shipping.
Heath QF-1 Q-Multiplier very nice condx, no scratches $15. + ship.
Icom U-16 UHF HT never used, NIB $60.
Several ARC-5 Tx var. caps and smaller air var. caps & trimmers.
** Not going to cart this stuff to fests, will be tossed 1 week from today.

From the WA9USE Estate listing, we have tested and checked out these items on the air and into a dummy load; Prices are estimates, offers are requested and will be considered. S&H cost will be added from 23320. k4wys@cox.net

1 ea. Drake TR-4 HF SSB Transceiver S/N 32305
Receives & Transmits 130-90 Watts (Finals Replaced) Needs Microphone
$300.00
1 ea. Drake Model AC-4 Transceiver Power Supply S/N 39511
$65.00
1 ea. Drake SSB TR-4C HF Transceiver S/N 35297
Receives & Transmits 130-90 Watts (Finals Replaced) Needs Microphone
$300.00
1 ea. Drake Model AC-4 Transceiver Power Supply S/N 43501
$65.00
1 ea. Dentron Model HF Amplifier Model 160-10L (4-572Bs)
Operates & Produces over 1 KW w/ 80 watts drive
$500.00
1 ea. Wawasse Frequency meter Model JB 1004/B S/N 8373
$ 25.00

4163. Operating cw with a HW-29 Sixer

If you have ever operated cw on the Heathkit Sixer, I would like to hear about your experiences. How was the reception? Were any modifications necessary? I understand that you can plug in a key into the metering jack, according to the manual. I recently bought an E-bay rig, but I haven't put it on the air yet because I am awaiting parts to assemble a power cord. How much cw activity is there on 6M? Etc.

Thanks

Evan

The common method to put them on CW was to key an audio oscillator,
and feed that into the mic jack. It required no modifications to
the rig, and could be received in the other common transceivers of
the time. Those low end units did not have BFOs, and some, including
the Sixer, had superregenerative receivers, which wouldn't work
with CW either. But modulated the transmitter with a key'd oscillator
meant that such receivers could receive the code.

If you want to work CW with them, then you'll have to have
a separate receiver. There were modifications at the time of all
kinds for this. Some would add an antenna jack to the antenna relay
(or was it done with a manual switch?), so you could connect an
external receiver. Some would add converters to the units, again
to be used with an external receiver. I seem to recall reading one
article where they converted the superregenerative receiver into
a converter, to be used with that external receiver.

There would have been articles about adding CW to the units back
then. But, the transmitters were pretty simple, an oscillator
running at 50MHz and an amplifier stage, that likely doesn't work
so great when keyed. Likely lots of whooping. I think the A's
changed the circuitry to a lower frequency oscillator feeding
multipliers (unless that only applied to the A model of the Twoer),
but since they never got real complicated, again keying likely
has its faults.

Forty years ago, the low end transcievers for the VHF bands weren't
particularly good for CW (beyond their lack of key jacks), and not
something you'd try for anything much beyond local CW contacts if
then. They were useful because they populated the bands, and
especially on six metres, when the band opened up you could actually
DX with such simple and low power rigs, using AM. Don't forget
that back then, the US Novice license allowed operation on 2metres,
and up to a certian point, even phone operation there, so that
had a certain appeal.

But nobody who was serious would use such rigs. They'd get
a converter for their good HF receiver, and then build a transmitter
that started with a crystal in the 6 or 8MHz range, and then multiply
up. Neither the converter nor the transmitter were really major
construction projects.

Micheal, There were two mods to the Twoer and Sixer that I clearly recall. One was a balanced bridge squelch circuit utilizing some pilot lamps the other was an MCW mod, similar to the one for the Gonset Communicator. An RC feedback circuit is created that generates an audio tone. I'd have to look at some QSTs from 1962 (That's when I built mine) to see what's up after all these years.

Regarding operation, from Dover AFB, I could talk on 6 meters with stations in the mid-Atlantic during good propagation. 2 meters was a close range deal and I don't recall ever doing any real "DX" on that band with the Twoer. Back in the DC area, I could talk with the locals, of course.

How are you going to save a life with CW? If someone is having a heart
attack he's not going to be steady enough to type out an SOS to you.

No planes use morse code. No ships do either. Just who do you think is going to send you an SOS?

4171. National NC-120 audio transformer

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-02 20:24:55 UTC
From: Don <c696@earthlink.net>
Message-ID: <1162499095.611531.317420@m73g2000cwd.googlegroups.com>
Source record: 10320

I need an audio output transformer for an NC-120, which I understand is the same as the military RAO. I have also been told the NC-100 is the civiliam model. The ROA-2 manual lists the transformer as 36000 ohms to 600 ohms but the NC-100 manual lists it as 5000 ohms to 500 ohms. Is the 36000 a misprint? The transformer couples the 6V6 to the loudspeaker. The National number on the transformer can I took out of my NC-120 is CNA-30884
Thanks

Hi Don...

It appears to be the same transformer that is used in my RAO-3. The
specs in my manual are identical. The only thing I can figure is that
many shipboard radios were not designed for use with a loudspeaker.
The audio normally went to a distribution panel and was routed to
an amplifier located somewhere else on the ship. This ratio may be
necessary to limit the audio output from the receiver to prevent
over driving the headphones or external amplifier.

> YMMV
>
I have dealt with only two SP-600's. One is probably a JX-21 but might be a JX-21(it was missing the tuning unit cover when I got it), the other is a JX-17. Both have had bad silver micas in various places. The JX-17 was out of service and in storage for several years. It was re-capped at some time in the past so I didn't have problems with the ceramics, but I had to replace about 5 silver micas in various places. The JX-21 had about 3 bad silver micas. I replaced a lot of the BB's in the 21 but have not completely recapped it except for the RF deck. I've had the 21 for some 30 years and am still workign on it on occasion. It was basically a parts receiver when I got it. The JX-17 nearly mint but nonetheless had problems. Its now quite stable and works well.
BB capacitors were advertised as deluxe, high stability, parts when new and are found in a lot of high quality equipment. I first heard that they were trouble makers more than 30 years ago. Silver mica caps are supposed to be among the most stable of all but I learned long ago that they often had a stability problem resulting in a small, rapid variation of capacitance sometimes called scintillation. I have no idea of what the physical change is that causes this problem, your suggestion of migration of the silver is as good as any. Its also obvious that dipped epoxy encapsulation is far more stable than the old molded plastic (Bakelite maybe) types.
BTW, the stability of the SP-600 is affected by line voltage variation due to lack of heater regulation. I have a Sola constant voltage line transformer that helps with this.

4177. National Receiver Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-03 01:12:43 UTC

Message-ID: <flw2h.21362$TV3.9114@newssvr21.news.prodigy.com>
Source record: 10327

I have a National RAO-7 military receiver that I recapped about 5 years ago. I also replaced a few out-of-tolerance resistors. The receiver performed well beyond original specifications at that time. It was unused for about the last 2 years and now when I listen to it, I get distortion in the audio output at about 1/3 to 1/2 volume. The more I increase the volume, the worse the distortion becomes.

What might this be a symptom of?

Thanks in advance for your advise and help.

Cal in TX

> Cal in TX Cal, I would first check the coupling cap from audio driver plate to output tube 1st. grid,,,It will probably be about .001uf.. change it...also look at the audio output tube cathode ,,,cap from cathode to gnd..maybe 10 to 20 uf. When the coupling cap leaks ,it behaves like a resistor, putting a DC voltage on output tube grid..output grid should be a neg v to gnd...when cap leaks the grid will become pos v..That is usually the problem....GL W4PQW

The NC-100 has a number of differences from the RAO, for
one thing is has 2 RF stages. The two use different output
tubes which may account for the different transformer. 36K
does sound like a rather high load impedance for a 6K6
though, more typical is around 10K. The only power output
spec I could find is for the headphone jack, which is
parallel with the speaker terminals, 0.3 watt, that's low
for a 6K6, more typical would be around 2 watts.

I need a replacement audio transformer for a National NC-120. This transformer connects a 6V6 audio amp tube to the speaker and/or earphones.

4186. Heathkit SB-240 PROTOTYPE !!!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-03 14:06:07 UTC
From: Sindre Torp <sindtorp@online.no>
Message-ID: <WLOdnV4S8dVX0dbYRVnzvQ@telenor.com>
Source record: 10336

Hello,

I have a Heathkit SB-240 linear amplifier. This is a prototype!!! It matches the SB-104 line in design.
I got this one from my friend Mike Elliot (the man behind SB-104 and Drake TR7). He is now silent key.
The SB-240 has two 3-500Z tubes, and built in power supply. I have full documentation for it.
I have it stored in USA at the moment. I'm considering selling it for a serious price. That's why I have not got it shipped over to Norway yet, where I live.

I don't think there are any more SB-240 out there. I've never heard of any. If you have any more info about the SB-240, please drop me an e-mail.

You may take a look at it here:

Sort of looks like a front-panel re-do of the SB-220? I'll bet the schematics are identical, except for the metering circuits.

>> Hi Don...

My tube manual lists the load impedance as 7600 ohms for a 6K6 with
250 volts on the plate. The 10k transformer will not provide full
output from the tube but should be substantially more than the
original transformer. No risk of damage to anything but your ears
if you plug headphones in with the volume turned up!

Google search seems to indicate that the SB-240 final was/is an 8873 not two 3-500s.

Hi,

Well, the SB-240 has two 3-500Z tubes. And so says the original manual I have for it.
All the paperwork is original and with some comments etc. written by Mike Elliott by hand.
Mike told me that he was the man behind it.
I'm by the way also the happy owner of the very first Drake TR7 prototype, serial no "XXX1". I got this one too from Mike. I have several other Drake prototypes as well, the TR8 to mention one.

There is some variation from manual to manual depending on
the exact operating conditions specified. For instance the
6K6 page from the RCA Tube Handbook at
http://www.pmillett.com/tubedata/HB-3/Receiving_Tubes_Part_2/6K6-GT.PDF

Shows three values of transformer load impedance:
For 100V on plate and screen grid, 12,000 Ohms for 0.35 Watt
at 11% THD
For 250V on plate and screen, 7600 Ohms for 3.4 Watts at 11%
THD
For 315V on plate and 250V on screen (maximum ratings), 9000
Ohms for 4x5 Watts at 11% THD

I don't see any voltages in the on-line handbook but they
should be easy enough to measure. In any case the
transformer impedance does not seem too critical. Check the
bias voltage to see what it is. You may want to change the
cathode resistor. The handbook gives the recommended bias
value.

Since the headphone jack is just paralleled across the
speaker terminals it might be useful to put a load resistor
across it when using high impedance phones.

In my early ham radio days, I used to trade rigs a lot. Back in the 60's I had a transmitter for a short while and I can't remember the model number. It was old at that time and I am pretty sure it was a National but I am not even sure of that any more. (A mind is a terrible thing to lose :-) It covered 80 to 10 meters (possibly160 meters also) and had a 4-65 tube in the output stage. The unique part was the transmit modes however, CW and FM. Can anyone enlighten me on what it actually was? I seem to remember NC-27 but I tried searching the web and didn't find anything.

Tony, when the receiver is turned off, there is no power to any circuit
and the S-meter should be at zero. If its up scale, its probably sticking.

You will find a handbook at:
http://www.rigpix.com/hallicrafter/sx117.htm
There may also be one on the BAMA site.
The S meter appears to measure the cathode current of a
controlled IF stage so its a "backward" meter which should
measure maximum up-scale with the power off.
Sticky meters can sometimes be fixed by finding the
mechanical zero adjuster and working it back and forth
several times. If this does not unstick the meter one must
get into it and clean the mechanism. The stickyness may be
just dirt in the meter bearings but can also be caused by
metallic particals caught in the air gap of the magnet.
Meters are quite delicate so if you decide to open it up be
very careful. With any luck the zero adjuster trick will fix
it.

Hi Jeep,

glad to read from you again.

The Hallicrafters SX-117 meter must at be at full scale when the receiver is off. When it warms up the meter goes to zero, and then it works normally. It is the same on my SX-146.

The only thing I was worried abuot is that the meter is not quite at full scale (9+40 instead of 9+60) and there is no adjustment. But now I have realuzed it is only a matter of static charges, as removing the plastic lid the meter goes to 9+60. And when the lid is not yet in place the meter reading varies a lot with lid distance, this clearly signifying static charges. I washed the lid with water and now all is OK.

Did you already change your QTH^?

I had looked for SX-117 pictures on the web, but I could not find a picture clear enough to determine whether the meter is at full scale or quite full scale when receiver is off. The picture on the instruction manual is not clear enough either. I was looking for someone who owns an SX-117 and can look at the meter.

> Sticky meters can sometimes be fixed by finding the mechanical zero
> adjuster and working it back and forth several times.

The SX-117 meter has no adjustment

But I have finally determined that the plastic lid has static charges and the meter indication strongly varies with lid distance. So I washed the lid with water and the static charges have totally disappeared. The meter is not at 9+60 steady. Still, as the scale end is actually 9+70, I would still like to hear from an SX-117 owner whether the meter is a 9+60 or 9+70 when receiver is off.

The illustration on the web site above clearly shows the
meter at full scale. Perhaps the cover should be treated
with some sort of anti-static cleaner.
Not all meters have external mechanical zero adjustments
but most have some sort of internal adjustment. Does it go
to full scale with the cover off?

> with the cover off?

Yes it now goes to full scale with and without the lid. So the problem caused by the static charge is solved. But still I cannot determine from the available pictures whether the needle should be on the last number (+60) or at the very end of the scale (corresponding to +70). Need somebody to look at.

I guess a definition of "full scale" would have been appropriate...hi!
These meters are designed to operate backwards so "full scale" is in
reality, all the way to the left. National often simply turned the
meter upside down to get the same effect. But.. its all a matter of
semantics.

4223. Wanted: WW2 radio items for B-17G restoration

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-06 18:57:27 UTC
From: k5dh@raytheon.com
Message-ID: <rAL3h.5$gh3.0@dfw-service2.ext.ray.com>
Source record: 10273
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Hi all,

I'm gathering original WW2 radio equipment for use in the
restoration of B-17G Flying Fortress 44-8543A, "Chuckie",
operated by the Vintage Flying Museum of Fort Worth, TX.
Yesterday I did a quick inventory of the equipment we have
in storage. We have most of what we need, but we still
lack some very important pieces.

We need the following SCR-274-N command radio items:

BC-442 antenna relay ass'y with RF ammeter and vacuum cap
BC-450 control box for three receivers
BC-451 control box for four transmitters
BC-458 transmitter, 5.3 - 7.0 mc
Any and all types of connectors associated with SCR-274-N
Ceramic "beads" used as insulation on the antenna leads

We need the following SCR-287-A liason radio items:

FT-142 mounting tray for BC-306 antenna coupler
PL-59 connector (need 2)
PL-61 connector (need 2)
PL-64 connector (need 1)
SA-13 knife switch (I think it's a 3PDT)
RL-30B trailing wire antenna motor and spool ass'y
F-10 trailing wire antenna fairlead ass'y
MC-163 trailing wire antenna element
DM-28 dynamotor for BC-348 receiver
J-37 telegraph key (NOT a Winslow part, too new!)
Ceramic "beads" used as insulation on the antenna leads

The equipment must be in excellent original condition with
no modifications, but it does not have to be electrically
operational.

We are a small museum, and we have no money to buy this kind
of stuff. It takes all of the money we can muster to keep the
Museum open and the B-17 flying. We're looking for donations
here. We are a 501c(3) non-profit organization. All donations
of equipment, money, and services are tax deductible. If you
have any of the equipment we need, please consider donating it
to us, and help us to share history with future generations.
Thousands of people a year tour the B-17 at air shows and in
our hangar. Chuckie is one of only TEN B-17's still flyable

in North America, and not all of those ten are flown with any regularity.

Here is the URL for the Museum's web site:

http://www.VintageFlyingMuseum.org

Thanks in advance for your kind consideration, and also a big Texas-size thanks to those of you who have donated equipment and services to us recently:

KB1LNA, Charles Geis (complete BC-375-E transmitter station)
KX8XX, Mark Schmidt (UNUSED tuning unit TU-26B w/orig. box!)
Jim Bane of Jevic Trucking Co. (transportation services)

I donated a BC-348-R receiver, BC-459-A transmitter, and T-17 pilot's hand mic from my own collection!

73 to all,
Dean Hemphill, K5DH
B-17G 44-8543 "Chuckie" volunteer crew member
Vintage Flying Museum
Fort Worth, Texas

From: Randy <anon@anon.com>
Message-ID: <ell22.kad.19.1@news.alt.net>
Source record: 10275

I have a Yaesu FT-767 coupled to an Ameritron AL-811. The cables, power cords, etc. are all hooked according to instructions, but the amp, while powered on, will not "kick" in.
The manual that came with the 767 (I bought this rig new) says only that the TX GND phono jack is connected across contacts of a special transmit/receiverelay in the FT-767GX, which are closed circuit during transmission, and open circuit during reception. "Note: Internal switch s2002 (on the rf unit) must be set to the ON position when the phono jack is used.

What the manual fails to show is just where this switch is! Yeah, I know. It is on the RF unit.

Can anybody shed some light on this? Thanks in advance.

The 8873 was used in the conduction cooled amp (the 230 as mentioned
above) which had a front panel *similar* to the one shown below, at
least from a distance.

Also different: the entire back panel was one great big, black,
heatsink.

4228. Broken coil glue recommendations?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-08 01:47:36 UTC
From: Smokey <nospamrtelegrapher@hotmail.com>
Message-ID: <12l2ds18i60k114@corp.supernews.com>
Source record: 10278

I have an oscillator coil that is a standard fiberglas tube with a threaded iron slug that moves inside. Outside of the coil is windings of #22 wire. While servicing the radio the coil inadvertently was broken midway down the fiberglass core. The #22 wire windings are intact and the two broken fiberglass coil sections matefairly well without too much wobble or play. I really...REALLY...don't want to replace this coil if at all possible. Does anyone have any recommendations for something I can wrap or paint on the whole coil to reinforce it while providing little or no detuning. I've thought of hot glue guns, epoxy, fiberglass tape or some of that new liquid electrical tape but I am interested in what the group thinks. Thanks a lot!

Q-dope, which is styrene. In a pinch you can melt styrofoam cups in toluene
and use that, but the GC Electronics Q-Dope is inexpensive and easily
available. You could also use glyptol, although the dielectric absorption
isn't quite as good.

I have use J-B WELD type J-B KWIK glues with good results on HF coils,
e.g. BC-610, SP-600, etc. Its a 2-part epoxy and holds up very well.
etc. I have noticed no de-tuning or changes in inductance that is
detectable. Given what you have, would not a super-glue also do the job?

Source record: 10285

The Johnson 6N2 may not be the best choice for a linear amplifier conversion, although I am not sure what you mean. If you mean to use the cabinet to build a low band amplifier, it seems like it would be easier to start over. If you mean for vhf use, the output tube does not have a lot of plate dissipation, so would not be a good linear amplifier for the vhf bands either.

It would be more easily converted to a transverter, which could also be more useful.

There seems to be a bit more interest in 6 meter am, and the unit may be more valuable as is.

I'm presuming you are talking about the 6N2 100 watt xtal controlled transmitter (and not the Johnson 6N2 Thunderbolt VHF KW amp) originally meant as an outboard unit for the Ranger (to get DC and modulation power) to get on 6 or 2, AM/CW.

IIRC, that rig has a 40 watt plate disipation 5894 dual tetrode in the final (push pull, with neutralization).

For linear operation, the only mods you would need would include DC bias for the control grid, and fairly well regulated screen grid voltage (necessitating some disconnection of, IIRC, a clamp tube that protects the 5894 against loss of drive-generated control grid bias).

You would have to look at a schematic to identify anything else that would need changing. The rig has an oscillator-multiplier string with tuned circuits for frequencies far from the 6 and 2 meter bands, so you would need to feed excitation into the 5894 at the push-pull input RF transformer rather than somewhere else.

I need the logging scale and associated front panel hardware for a Hallicrafters SX28 restoration project. These parts were missing from my SX28 'as received'. The main tuning knob has major internal wear - I'm considering a steel? Al? bush to go onto the shaft and getting the knob machined to 1/4" or 5/16" ID. Advice from those who've 'been there, done that' would be appreciated.

It's an SX28U (110/220 V switchable) s/n H159134

Tks,

John Mackesy VK3XAO

Thank you for your replies : I have several low output rigs (
Ten-Tech526 , Yaesu Ft620B). My thougts were to make a linear amp out
one of the two 6n2 that I have.(ssb) Either using the original 829 B
or changing to another tube. The output circuit looks so good , I do
not mind changing anyting in this rig it will just be a 6 meter or 2
meter amp. The other 6n2 would be for just AM, doing away with External
modulator, just adding a external power supply Well these
are my ideas Note: 6n2's cost under $30 so no big loss Tnx JB

There's a glue called "Amazing Goop", also sold under the name "E6000",
that works very well. It's available at many hardware stores and craft
stores in the U.S. It requires 12~24 hours to cure, but afterward is
very strong and seems to have no detuning effects. I've used it for many
years now.

I have a poser for the group: I just obtained a fairly rare PP-32AR AC power supply for the Hallicrafters ARR-5 and ARR-7 receivers. As an airborne unit, its designed for 115VAC, 400-1000 HZ operation. I have worked with modern 400Hz power supplies and appreciate the nuances of same. I also have and use some rather "broadband" power transformers that will run from 50 to 1000Hz power. The PP-32 was designed and fielded in 1943 and would have employed technology of the era, obviously. The transformer in this supply, given ratings, is arguably the same size one would expect for a 60Hz unit; its fairly massive, especially when compared to the compact units you'd expect in a modern airborne supply. My question is, then, does anyone agree and suggest that this unit might well work on 60Hz AC? As an aside, when I popped the cover off, I noticed a chunk of ac lamp-cord soldered to the inside of the Cannon input power receptacle as if some had run it (perhaps?) on household current. Could these early 400Hz transformers have actually originally been appropriate for 60Hz? I know (think?) that some folks ran their APR-4 airborne receivers on 60Hz and they are of the same generation of equipment. Finally, I note that there are no markings on the transformer other than the pin designations. Also, there is a 80v input tap on the primary for whatever reason; the book does not mention it. I plan to try the 100w light bulb trick to see what might happen but if anyone has any insights, I certainly like to hear them.
Tnx de Jeep/K3HVG

I would be VERY skeptical. Get it on a bridge and measure it. If you
don't have a bridge, try putting it in series with a 60W bulb, measure
the voltage across the bulb and the voltage across the transformer and
ONLY do that for a few seconds.

It is possible they might have used a transformer capable of running
on 60 Hz. It's also possible that the size is deceptive and it will
explode into flames on 60 Hz the way modern 400 Hz transfrmers do.

It will, of course, require much more supply capacitance even if the
transformer works without overheating.

>As an aside, when I popped
>the cover off, I noticed a chunk of ac lamp-cord soldered to the inside

Try the lightbulb briefly, measure voltages, and see how much current
the thing is really going to pull when you plug it in, before even
thinking of plugging it in.

I'd suggest using the lightbulb method, but disconnecting
all loads on the secondaries. If it starts drawing much current,
say more than 1/4-1/2 amp, you know it won't work with a load.

As someone else mentioned, you'll need to put in much bigger
filter caps if you run it a 60 Hz as well.

Good luck!

Steve

Well, to all those who offered replies and info, the results of the light-bulb test are in. At about 30v applied via Variac, the windings began to chatter and the current was observed to be much too high. So, its obvious now that it will not function. As mentioned, though, I have suitable transformer that will mate the existing bolt pattern... how's that for luck!!! Again, many tnx for the insights.

If we eliminate the Code requirement, you'll be wishing Kenwood could come up
with a Lid Filter. Markie is proof you'll need one.

4262. Collins, Drake etc to Ft. Wayne

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-12 23:10:09 UTC
From: Henry Kolesnik <kolesnik@sbcglobal.net>
Message-ID: <lRN5h.24751$TV3.7609@newssvr21.news.prodigy.com>
Source record: 10162
Cross-posted to:
rec.radio.amateur.equipment,rec.radio.amateur.boatanchors,rec.radio.swap,alt.ham-radio.marketplace,rec.radio.shortwave

It looks like I'm going to the Ft. Wayne hamfest, will be there Nov 17 and
Nov 18 till about 1 or 2 PM.
I plan on bringing the following if there's any interest:
Collins 30S-1 $1600.00
Collins 32V3 $1600.00 spare final and matching Astatic T-3 mike
Collins 30L-1 $600.00 Round 2 spare finals
Collins KWM2 Round $600.00
Collins 651S-1 $1100.00
Drake L75 $1000.00 One 3-500Z with internal supply 160 thru 10
Central Electronics 100V $600.00
Cubic R-3030 dual communications receiver VLF HF $1600.00
ITT Mackay Marine R 3021A VLF HF $600.00
Hallicrafters SX 62A $200.00
Hallicrafters S-40B very clean $125.00
All items in above average condition, very little wiggle room on price as
they're going to eBay if not sold or traded.
I'll be driving I 44 Tulsa to St Loius and perhaps a bit beyond afternoon
Nov 16 and on Nov 17 driving I 70 to Indianapolis and I 69 to Ft Wayne
arrving early Friday afternoon. I might be able to stop along the way
depending on where and the time.
I'd also consider a trade on good acoustic dreadnought guitar from Martin
HD 28, Taylor 810 or 910 or Gibson or a good older 5 string banjo.
Let me know
Hank wd5jfr

4263. Looking for 50 KHz IF used in Hallicrafters....

Just discovered that one of the IF cans in my SX-117 has an
open winding. I know that many Halli receivers used the
50.KHz IF, and probably the same coil. The part number
is 050-200735 which is printed on the top of the can.
Thanks!

Steve

These are the most primitive of tube-testers. Not terribly useful in
any of the venues where posted.

About worth the $9.99 opening price if shipping is free.

Why don't you fix it? It's big, and the failure is almost always
right where the wire is soldered to the terminal.

Chuck,
Already tried to repair it. The break is in the coil, not
at the terminals, or exposed wires. The coil is encapulated
in a ceramic goop I've never seen before. Removing it
will destroy the windings. As a result it'll be hard to count the
windings (its a center tapped coil with unknown tap)even
if I have to rewind it.

Also tried the high voltage arc technique where you use
a HV supply with a big (12K ohm, 10 watt) resistor
in series hoping to weld the break to another adjacent
winding. This worked briefly...

Groan.

Do any people specialize in rewinding these things? Maybe you could
send it to someone who rewinds transformers.....

RATS!

The coil is encapulated
> in a ceramic goop I've never seen before. Removing it
> will destroy the windings. As a result it'll be hard to count the
> windings (its a center tapped coil with unknown tap)even
> if I have to rewind it.

I've seen this stuff before. It shatters pretty well on
coils. You might be able to get it off of the coil and
count the turns... but they you are bound to find that
the coil is wound in litz wire.

> Also tried the high voltage arc technique where you use
> a HV supply with a big (12K ohm, 10 watt) resistor

I have had good luck doing this with a Sencore Z-Meter capacitor
tester. I keep upping the voltage until I get continuity. Then
I blast it a few more times for good measure.

These things were great when I was a kid, because you could buy them for $1.49 at the drugstore and you got a neat project box with one of every kind of tube socket you'd ever need. Problem is that I kept winding up with lots and lots of leftover compactron sockets from the things.

>About worth the $9.99 opening price if shipping is free.

$10 seems a bit much for one, and it's not useful for testing tubes at all, but it DOES belong in a display case somewhere so future generations can see how foolish some end users were.

Even Accurate only called it a utility tester. It is used for testing
appliances and such. Poor guy asked if it would test 12AX7 and guitar
amp tubes and the answer was yes and if the filament is good the tube
would be probably be OK!

The 6000A is the "other" version of the 6000, and therefore came with the more recent sockets. So, 7 & 9-pin miniatures, compactron (9 & 12 pin), Octal, Locktal, nuvistor, transistor & VOM. It will not test its own 4-pin 83 mercury rectifier, for instance. It is also much more limited than the 539-series inasmuch as it does not have variable bias,

does not have a way to test plate and filament current directly and one

must choose between which vintage tubes one is able to test (without adaptors). So, as a general-purpose GM-type tube-tester when matching is not a
requirement and pre-octal tubes are not used, it is an excellent option.

Note that the 6000 option (both the 6000 and 6000A were offered at the same time) does test pre-octal, octal, locktal and 7 & 9-pin miniatures

(also transistor & VOM), but NOT nuvistors or compactrons.

As to the price, that is between the buyer, seller and their respective

gods.

Peter Wieck

Most nice 6000A's bring between $200 and $300 on the well known auction
site.

You're right-in no way is this an alternative to the 639C (or any of the 639
series, for that matter).

It has one serious drawback that you didn't mention. Most Hickok designs
allow you to reset the line voltage while the tube is under test. This
allows you to compensate for the added load and consequential drop in all
applied voltages (filament, plate, bias, and screen).

The 6000/6000A testers specifically do not allow this.

Maybe somebody should've bought that "toy" from last week.

Yeah, but wouldn't it work with the Hickok 6000a in another thread?

4277. More Radio-mart lies!!!

Newsgroup: rec.radio.amateur.boatanchors

Source record: 10177

A couple of months ago, Radio-mart's alter-ego, gottahaveit1995 bought a radio from me on ebay, the same radio I bought from him 3 years previous. When I first got it, she smoked and looked worse (repainted, not original color) than described. Eventually I got it running and enjoyed it for those years. As I said, Martyn bought it back (probably doesn't remember it), so for the last couple of months, I've been checking his sales for it and sure enough, there it is for sale.
Of course I have no problem with someone buying to resell, but the non-factual things said:

1: Pristine shape....Not! Certainly not since it's been repainted in something other than original colors

2:Chassis shines.... You can see the rust in the picture if you look closely

3: Purchased from 2nd owner who had it for 20 years before it was put into dry storage...I've already
mentioned this lie

4:Main & bandspread dials work perfectly smooth....Main dial had backlash and was annoying to use

Anyone bidding on this will get a nice radio, but far from what is described. All you buddies of his need to rethink your criticism of those of us who take the time to point out this persons activities.

Hello Steve:

I grabbed the SX-100 schematic and see that it uses tapped (but not center tapped) transformers in the second and third stage. I suspect that these are the same transformers, with the same taps. Hallicrafters probably used the same transformers for the SX-96, the SX-100, and the SX-101. The S-76 was one of the first to use the 50 kHz (whoops kc) transformers. I know there are a lot of parts units floating around so you might check the manuals of those to see if they are the same.

It is late and bed time, but I have the SX-96, 100, 101, 88, 115 and 117 I could check (no you cannot have the transformer out of my 88).

Although you could duplicate the coil, it should be fairly easy to find a replacement. That way, you will not have to determine the tap and duplicate the coupling.

73, Colin K7FM

Hi Colin,
Thanks for the info. It'll be useful as I'm looking for parts.
Luckily I found what I need and it should be on its way soon.

I'll be hauling a flatbed trailer from Bozeman, MT area to Seattle starting morning of 11/8 and returning 11/11. Will be bringing fullsized car back that my daughter and her husband ran out of oil on Snoqualmie Pass, trashing the engine. I will have deck space for radio gear if you have somthing big and ugly that needs to be transported either direction along the I90 corridor. Rates are very reasonable, meet me near I90, contact on 2 meters. You must pack and cover for bad weather. Call me ASAP for information.

But SSTV was never "boatanchor" by the time it was a commercial product.

Maybe when Copthorne McDonald started playing with it in the fifties,
large and bulky and tube based, it might be considered boatanchor.

But, now, you'r just mistaking this newsgroup for a buy and sell newsgroup,
which it isn't.

Michael

Me thinks I've seen them before...? Some low-power mil rig...
battery-powered as I recall... Looking at the primary Z, looks to be a
3Q4 output tube or something of the sort.

I think his point is - you most likely sold it with good tubes already since you are a technically savy amateur, and an honest man wouldn't sell a radio even to Radio Mart with bad tubes in it. Radio Mart didn't need to test the tubes, and certainly didn't put $130 worth of new tubes in it. So for him to even post that it needed new tubes is essentially saying you sold him a basket case.

I am looking for the schematic of the the Navy Receiver RU-17. Google
and looking at the usual places (Bama, Tannenbaum, Milist, etc.) hasn't
scared up anything.

Know any links or good places to look?

TIA.

That is correct according to a diagram in a James Millen article for the
"All-A.C. Version of the Receiver" QST, unknown date.

>
> My receiver is set up for 2.5 volt filaments and I would like

The SW-3 Model II used 58, 58, 56 (2.5 volt) or 6C6, 6C6, 76 (6.3 volt)
tubes interchangeably. This version used "30-40" series coils.

Hi Roger,

Regarding the tubes, I now see what you mean. The SW-3 here contains 6D6 tubes.

4311. Heathkit HW-16 questions

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-15 04:02:19 UTC
From: k5dh@qsl.net
Message-ID: <UrudnbY_C7nWDMfYnZ2dnUVZ_s2dnZ2d@centurytel.net>
Source record: 10209
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

I'm resurrecting an HW-16 that I picked up at a swap meet last month. I've gotten it working, aligned it per the manual, and the tubes are all good. Output power is about 45 Watts on 40m and 80m, and about 30 Watts on 15m, about what I expected. I do have some questions for you HW-16 experts to ponder:

(1) The receiver is the most sensitive in the middle of the VFO range, and the sensitivity falls off a lot toward the ends of the VFO travel, regardless of where I have it tuned when I do the alignment. All of the alignment adjustments work like the manual says they should. Any ideas on what might be wrong? I've owned HW-16s in the past and I don't recall this being the case with them (poor memory?).

(2) How would I change the audio frequency of the neon reflex sidetone oscillator? 1 KHz is too high for me. I'd prefer something around 750 Hz or so.

(3) The transmitter is chirpy. I know, all HW-16's are chirpy. I found a mod on line which suggests adding a 220 pF mica cap from the screen grid of the oscillator tube to ground to combat the chirp. I tried it, and I find that if I add capacitance there, the oscillator gets extremely sluggish. I tried various values from 100 pF to about 250 pF. Any thoughts on this?

(4) How can I increase the level of the spotting signal that's heard in the receiver? If I could bring it up high enough, I'd consider disabling the harsh sidetone oscillator and just listen to the transmitted signal as my sidetone, which is what I do with my homebrew tube transmitters and Drake 2B receiver.

Your thoughts on any of this would be appreciated.

Thanks and 73,
Dean K5DH

Thanks for all the answers to my questions. It appears
that the remote cutoff 6D6 is the tube of choice.

I'm wondering if the failure of the voltage divider is
a frequent occurance or if someone tried to operate the
receiver with excessive voltage?

Thanks and 73, Roger N1RJ

77, 78, 6C6 and 6D6 are all very inexpensive. Get two of each and see which
you like best.

>

If it's a candohm, this is a frequent occurrence. Seldom do I find a radio
with a candohm that doesn't have at least one open or intermittent section.

i've been looking for an sx 42 for about a year. i was eyeballing this very unit and i thank you for this most informative post.

as i've watched these get knocked down for what i consider inflated prices, i thought i would just ask: these are popular units. what are they worth? i know what dachis sez, but that's years ago and pre-E-prey. people seem to bid to any level to obtain one, well past where i am willing to go. i am talking about a working (safely, sensitive all bands) unit w/original paint (not perfect) and some dings/scratches. it would need alignment, some cleaning and maybe a couple of better tubes swapped in. slight rust spotting chassis ok. in other words, should i quit looking?

i have an opportunity to buy one in non-running, but otherwise good (external cosmetic) fair (internals). i guess you would call it 'restorable' but not 'collector quality' whatever that is. it will require a lot of cleaning and certainly debugging - caps etc and maybe a tuning eye tube w/other tubes. no readily apparent mods/cludges. furniture looks to be original. i am not familiar w/nationals and have never worked on one but i like the looks and the period. if i put in the work, what will i have? -- i am familiar w/some of the older halli's like the s-19 and the halli line in general. how good was national built and engineered and to work on? what typically breaks that i will never locate a spare for? can we compare it to a halli i would recognize? i have a basic ref on receivers of the era and i have picked up the bama docs, but they don't answer the 'is it worth it? and 'will you hate yourself for trying it?' the ref book seems to say the 100 was from the 'good' 'old' national.....

i know this isn't very focused, but i appreciate any opionions.

Source record: 10220

The NC100X is a classic National design using catacomb coils switching, designed by James Millen. Assuming the coil sliding mechanism is not damaged, it should be easily restorable.

It is a band switching HRO design. These radios carried the allies through WW II. The decoding specialists preferred National (although they were often the HRO variety).

The CAA (prior to the FAA) used similar models for communications on the national airways. Many operated for decades.

And, they have the art deco look to them. They can hang out with the best of them.

> case with them (poor memory?).

No your memory is correct - I am making the assumption you have noticed this on all bands. More than likely one of the 3595 khz xtals in the xtal filter has changed activity level - let's try bypassing it - run a wire between C65 and the point at C66/R39. You should get a much wider IF sig now. Now check your sensitivity at both ends of the dial.

> (2) How would I change the audio frequency of the neon
> reflex sidetone oscillator? 1 KHz is too high for me.
> I'd prefer something around 750 Hz or so.

You can try changing R64 1.5M to 5M. Remember T=RC so a lower resistance value should lower the osc freq. You might want to put a pot to adjust freq. To decrease volume increase resistance R63 - try a 1K to start.

> (3) The transmitter is chirpy. I know, all HW-16's are
> chirpy. I found a mod on line which suggests adding a
> 220 pF mica cap from the screen grid of the oscillator
> tube to ground to combat the chirp. I tried it, and I
> find that if I add capacitance there, the oscillator
> gets extremely sluggish. I tried various values from
> 100 pF to about 250 pF. Any thoughts on this?

Yea this mod has been a around a long time. It's really for lazy hams that don't know no better. Chirp is caused by B+ instability (I.E. Voltage drops when hit the key - No Volt regulation) sooooo look at the skezmatic - see how the ENTIRE transmitter's B+ is tied to Point B (310 VDC). Whose brilliant idea was this ?!?!?!

First thing to do is ISOLATE the oscillator V7. Disconnect the wire coming from C4/R3/R4 to Point B buss. Tie this wire to Pont A in the power supply. Skezzzzmatic shows that this is the B+ supply for the receiver. It only provides only +175 VDC but it's more than enough for V7 to oscillate cleanly at only a slightly reduced level.

The Point A voltage is actually pretty stable when transmitting. Because the 700 VDC voltage drop from R207/R206 and R203 to 175 VDC that voltage changes very little at this point.

Doing this mod will make the HW-16 sound like a Kenwood/Yaesu/Icom on CW.

If you want to make it sound like a Ten Tec - place an OB2 volt regulator inline with the B+ power wire. OB2 will take the voltage down to 125 vdc but it will be rock solid. V7 Oscillator will be a pure T9er. OB2 is a gas tube so its cold - solder a wire to input pin and output pin and stick the whole thing inside a shrink tube. you can then place it underneath the chassis... or you could punch a hole and put a tube socket near V7.

> (4) How can I increase the level of the spotting signal
> that's heard in the receiver? If I could bring it up
> high enough, I'd consider disabling the harsh sidetone
> oscillator and just listen to the transmitted signal as
> my sidetone, which is what I do with my homebrew tube
> transmitters and Drake 2B receiver.

Side tone level comes from Bias Switch Q1 which does not quite switch OFF the receiver - R49 10K - try a 10k trim pot and adjust level to your liking.

> Your thoughts on any of this would be appreciated.

No thoughts - I've done these mods.... and have many more...

Spot Button - One thing I REALLY hate about the '16 is the fact your have to key up the transmitter to find out where the heck you are on the receiver dial. This is what is called QRM - which in CW stands for interference - This reflects on a really piss poor HFE (Human Factors Engineering) sooooo...

How about mounting a DPDT push button switch. One Pole would be used to key up the transmitter from the key jack. The other Pole would be connected between C7 and PIN 9 on the V8 DRIVER. Now when you push the SPOT switch - it keys up the transmitter and also disconnects the input into the DRIVER/PA so it doesn't go out over the air. You will find that lil oscillator is plenty strong Side Tone and the rest of us don't have to hear you "trying to find yourself"

RF Power - Pretty crappy power control. You adjust the RF power by varying the B+ into the V9 PA. Pretty damn STOOOPID design - Here is a better way....

Disconnect and tie the wires from points 2 and 3 of the R13 Power Level POT point together. Now the V9 PA will be going at FULL BLAST at all times.

Now disconnect the wire from B buss to R6. Wire B buss to Point 3 of the Power Level Pot. Shot a wire from Point 2 of the power level pot to R6.

You have just duplicated the same circuit but attached it to the IPA. Now you can go from full power down to about 2 or 3 watts. If you increase R14 you can get it down into the Milliwatt range and still go up to full power with a twist of a knob. YEEEHAAA - HW-16 makes a great QRP rig!

Have fun and don't worry about screwing it - wadda going to loose $20-50 ???

Got a HG-10B VFO ?? Remove one rear plate on STATOR (Fixed) of the variable cap. A slight trim adjustment and your HG-10B Now has a expanded CW band. Yes you loose the top end of the ham band and you have to do more "cranking" to move around from end to end - but it's more accurately set and is more frequency stable.

Hi, I'm looking for a Collins 30L-1 Round Emblem, High Frequency, Linear Amplifer. Not looking for any junk, actually I want one in excellent condition, Must be Round Emblem... Prefer one that has already been refurbished, things such as power supply, caps , etc...So as I do not have to do it...Although I've restored a few of them...I just want one in Excellent to Mint Condition...
If anyone out there has one of these amps, please feel free to e-mail me and if you like call 718-331-7427

Thanks a Lot
Carl

Thanks Biz! I was hoping you'd chime in, since you're the
resident HW-16 "guru" around these parts! I've printed off
your msg text and will begin experimenting on my rig as soon
as I can. It's too scruffy to "restore", but definitely a
good candidate for playing around with.

Baran's Surplus (Steve and John) have a quantity of cutoff U-77 old-family audio plugs for a buck each. These guys are a very reliable East-Coast (PA) surplus supplier. I have no affiliation with them and just wanted to pass on the info. The buy-it-now auction at $1 each is 150051941409 or search for "U-77/U cutoff". Shipping for my 25 of them was $15. Maybe that's a bit on the high side but its still less that $2 each. There were 75 left as of this a.m. Again, just passing the info..... Jeep/K3HVG

Keep looking, but not on e***y, where the price-jacking wars you describe are commonplace with items currently deemed desirable, like the SX-42 (and its repackaged equivalent, the SX-28), certain Collins equipment, and various others. Instead go to hamfests. Get the word out to anybody you know who might keep an eye out for you. And join a couple of the moderated forums where civility reigns and the posters would rather sell to other enthusiasts for a lesser amount than put their boatanchors up for auction and hope for big bucks.

> the SX-42 (and its repackaged equivalent, the SX-28),

How did you come to the conclusion these were equivalent? Having owned and restored both I am curious.

The SX-28 covered up to 43 mhz, the 42 up to 110mhz

The style was completely different

With the exception of the twin 6v6 audio output the tube lineup was different (The 42 used many loctals instead of octals)

The tuning mechanisms were very different

Even the Hallicrafters logo changed with that model.

FWIW I would take a 28 over a 42 any day

Scott,

The original transformer is still there, but the primary is open.

Yes, there are no taps on it.

The primary winding DC resistance on one of the other identical good transformers measures 870 ohms. With a primary rating of 10MA it is a low power transformer measuring 2 x 1.5 x 1.25 inches.

Thanks for your interest.

Some collectors and restorers did contact him before closing -- I also know
there are still a number of Zenith consoles (I saw them about 4 weeks ago).
This is the auction company (their photos and methods) he selected.

That's harder to fix yourself than the secondary, unless the open is
right at the end of the wind in the lead-in wires. But you CAN rewind
it by hand on the bench if you're patient, or you can pay Peter Dahl
company to do it for you.

Any idea what the actual impedances and ratios are? If you put 6VAC
into the primary of a good one, what do you get out the secondary?

It should be no problem to use an off-the-shelf Triad output transformer
IF the ratio is close to that of a standard transformer. The real problem
is that 10MA DC-leakage thing, but that's not insurmountable.

The consoles are obviously not included in this auction. In fact there is
nothing
antique or vintage in the pictures. The dumpster they mention in the
listings
would sure be put to use. He wants to use the auction as a way to clean
the shop
without having to do any work.

There was a time when everyone made them. If you were making a phasing rig, you'd need those to interface with the B&W phasing network (the ones that came in a package like a metal tube). The B&W seemed to be the most common, but I think the other similar networks (Central Electronics was another manufacturer) used the same sorts of transformers.

So look for a phasing rig, and the transformers will follow.

Michael and Scott,

Thanks for the tips. I did check Hammond and did not find anything suitable. The 51SB-B does use the B&W Model 350 (2Q4) audio phase shift network. I suppose my best bet will be to look for a junk phasing rig at a hamfest.

You can monitor the filament voltage with a voltmeter with the tube
under test and reset the line voltage.

The 6D6 is a remote cutoff tube and should be used in the rf amp position. The 6C6 is a sharp cutoff tube and either it or the 6D6 will work in the detector position. Some people think that the sharp cutoff types work better as a detector, others think that a remote cutoff tube might handle strong signals better in the detector position. Try both and use what works best!

The types 77 is a sharp cutoff tube, and the 78 is a remote cutoff version. These types are similar to the 6J7G and 6K7G (but with 6 pin bases instead of octal). They have different shaped bulbs and won't accept the close fit shields that fit the 6D6/6C6 tubes but might fit the larger National shields. They will work as well as the 6C6/6D6 tubes (different inter-electrode capacitance and gm but not enough to make a difference in this circuit). Also the 6U7G is the octal equal to the 6D6, the 6C6 has no octal equal. (not that you were thinking of rewiring to octal sockets....)

As for the voltage divider resistor, the schematics I found on the web show the total resistance was 12k, but I don't know what the taps were at. You could get a 10-15K 20w adjustable power resistor with an extra tap and make up your own. Looks like the lower tap would be at 30% and the upper tap at 60% based on the fact that the lower tap feeds the regen control (max voltage about 50) and the upper tap feeds the screen grid of the rf tube (about 100v) the set ran at about 150v total.
So you probably would get away with 3 5K ohm resistors in series.....

Hi,

Looking at the 51SB schematic, is the T-201 input transformer
for the antivox circuit the same as one you need?
If so, move that transformer over and use any generic
20,000 Ohm to 600 Ohm transformer for the antivox input.
(You don't need precisely 500 Ohms in the antivox circuit).
The antivox input circuit has no d.c. current at all
in the high Z winding, so any small transformer
will work there.

4348. SP-600 Tuning Backlash

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-18 21:04:50 UTC
From: Richard Knoppow <dickburk@ix.netcom.com>
Message-ID: <SzK7h.339$1s6.228@newsread2.news.pas.earthlink.net>
Source record: 10098

Some days ago there was a thread in this group (I think)
about the cause of backlash in the tuning control of an
SP-600. I can't find the thread now.
In any case, I ran into something the other day which I will
pass along. I found backlash could be caused by misadjusting
the ball-bearing load of the gear that drives the tuning
capacitor. This is a large gear about at the center of the
front panel. It drives the tuning capacitor by means of an
arm attached to the gear which has a post on it connected to
the cap. I found that if the bearing load is too light there
is backlash. I couldn't feel any looseness but I suspect
that if the screw in the front is not tight enough the gear
can wiggle a little causing the backlash. I had loosened
this one in order to lubricate the bearings and to
investigate if it was the cause of an overall slight drag in
the tuning system. It wasn't but I discovered the backlash
effect. Tighening the screw back to the paint marks on it
fixed this. Probably the procedure if the marks are lost or
someone has gotten the thing way off is to operate the
receiver with the front panel off (being careful not to
short anything) and ajust the loading while tuning a signal
with the BFO. You should be able to hear when the tuning
becomes mechanically stable.
In any case, this is something else to check. Normally
backlash in the gear system is removed by having some of the
gears mounted on spring loaded "spiders". While
correspondence about the SP-600 frequently mentions weak
springs in the spiders I am skeptical of this. Springs do
not loose strength with age despite the common wisdom. They
loose strength by being compressed or stretched many times
resulting in metal fatigue. The spider springs in the SP-600
are under pretty much constant compression and should last a
very long time. OTOH, I've found that the spiders can be
stiff due to lack of lubrication, or in one case, due to the
MFP lacquer gluing the spider to the receiver frame.
I pass this on FWIW and may be preaching to the choir.

Thanks for the tip Ed, but I have used T-201 to replace T-204 in the past. T-202 is bad. When all is said and done, I will probably have to use the two good original transformers as a matched pair in the output circuit (T-202 and T-203) to maintain balance.

I don't know why the audio transformers seem to be the weak link in this rig. The B+ is correct and I'm measuring 4 ma through the high Z winding, well below the rated 10 ma.

Requiring a test-socket and a VOM. Many Hickoks had this function built
in, hence Mike's note.

Richard,
I was the guy that had the SP-600 backlash problem.
The solution was indeed the pre-loading on the front
of the tuning cap. Actually, the ball bearing that the
adjusting screw hits was rusty causing a lot more friction than
usual. When changing direction while tuning I could see the
spring spiders flex, which led to backlash.

Steve

Hi,

Gene, you might consider picking up a Heath SB-10 sideband adapter.
It is a near clone of the B&W 51SB, and should provide the transformers
that you need inexpensively.

Good, the bearing is something that I think is easy to
overlook. I think I should clarify that this is not the
bearing adjustment on the back of the tuning condenser
itself (which I am sure an also cause trouble) but on the
gear that drives it. I ran into this after reading your post
and the thread it started.

Hi all, my name is Ted (KQ4MZ) and I just came into posession of a Drake R4-C receiver which I intend to build a Drake station from. For now I just plan to use this as an extra receiver. My question is how can I connect a coax to the antenna jack on the back of the receiver? I have never owned any older tube gear aside from old swl radios and have never seen a phono plug type jack for an antenna. Can I solder the center conductor of the coax to the pin on a male phono plug and the braid to the body of the plug? Any help would be most appreciated. I want to be able to connect the Drake into an antenna switch that I have all my other rigs connected to . Thanks again for any and all thoughts.

Ted---KQ4MZ

Pomona Plugs and others make adaptors to go from male or
female phone or RCA plugs to BNC or F connectors. The BNC
would probably be the best choice. Since the receiver
antenna connection will probably be going to a TR switch of
some sort you will need a cable with a BNC on the receiver
side and whatever plug the TR switch takes on the other
side. I would use BNC on both sides with another adaptor on
the switch side since you can get adaptors for BNC to nearly
anything. BNCs can be gotten with constant impedance at
either 50 Ohms or 75 Ohms.
Surprizingly, RCA conectors are pretty good at RF, in
fact, that is what they were originally designed for, they
just are not mechanically strong.

He said phono plug, not phone plug. They're two different beasts.

You can also get PL-259 to phono adapters, which might be a better solution than
using BNC.

Typing error, calling it an RCA plug should have been the
clue. The info above stands for phono plugs, all sorts of
adaptors are available for them. Even Radio Shack has some.
I mentioned the BNC because it is small and less likely
than a PL-259 to stress the RCA jack its connected to. Since
this is for a receiver antenna the cable can be of a light
weight type. The other end can have a PL-259 or whatever is
desired on it.

Ted -

The usage of Phono (RCA) jack for RECEIVERS and some QRP transceivers was very common in 1950s -- 1980s --- Collins S-Line, Heathkit and Drake.

I own a Drake R-4C --- that I acquired from an estate earlier this year This unit has required a significant amount of "clean-up" which I am still doing -- it was a daily user radio and owner appears to have been a smoker.

RECOMMEND:

1. BUILD a small (~ 3 feet) coax patch cable (RG-58-U) or 8X with a phono (RCA) jack -- one end to connect to Drake R-4C and the connector used for your antenna switch on the other. IF you don't have these skills -- most amateur radio service departments and Cable-X-Perts are happy to build this for you.

2. DO NOT hack or try to change that Drake R-4C connector. The phono jack field -- this 6 in-line phono connectors on a phenolic board on back panel - is UNOBTAINIUM. I have personally talked to both H.H. Smith and Switchcraft -- damage that -- and you would have to fabricate an entire replacement.

2A. I actually had to disassemble and repair the antenna and speaker jacks in that field last week --- the former owner had damaged the connectors. 2 hours of labor and some MAAS metal cleaning polish and these 2 jacks are almost back to factory new -- I was lucky the damage was not more extensive.

You should have jumpers for the MUTE, PTO Lamp on back panel and a jumper for 7-pin socket inside (if you have no noise blanker installed).

>Electronics was another manufacturer) used the same sorts of transformers.

You saw transformers like this in most audio equipment... you'd see a
single-ended output stage, often a 6AQ5 or even a 6V6, driving an output
transformer for a 600 ohm output. This was one of the most common
transformer types around because everyone used them for their output
stages.

But you're right... Hammond doesn't have anything in the catalogue,
although they do have a 20k to 32ohm output transformer.

Hi Ted,

One note, on some of these radios there isn't enough room on the inside
of the chassis for the long center pin (eg. original) RCA phono plug
to fit. I don't know if the Drake is in this group. You should take
a peek inside the chassis, and see if a protruding pin will get too
close to anything.

If you do find this to be the case, you can easily fix the problem
with a pair of diagonal cutters. Basically, you crimp the center pin
with the cutters a little bit, and rotate a few degrees, and do it again.
Just a little at a time, until the excess pin drops off. This rolls
the end over like the original, and makes soldering easier.

-Chuck

RCA connectors were designed to be cheap. Yes, they were intended for internal connections (both RF and audio) in radio/phonograph consoles in the thirties, but that's not to say they are constant impedance in any way.

If you see an RCA connector on an antenna input, you can _probably_ assume it wants to see a high-impedance longwire antenna. You may get better results from a 50 ohm source with some matching. Then again, maybe not.

Sowter 9915. Freaking expensive but it's what you want.
http://homepages.tcp.co.uk/~sowter/acatalog/SOWTER_PRO_VINTAGE_TRANSFORMERS_5.html

I am really, really surprised Hammond doesn't still make one.

>I don't know why the audio transformers seem to be the weak link in

>high Z winding, well below the rated 10 ma.

Probably because they got the cheapest possible transformers from a low
bidder, since they were commodity items. And they have a huge number of
turns of tiny wire in the primary, so it doesn't take much to damage one.

Carl,

I carefully came to that conclusion in a moment of complete brain freeze. I didn't get EITHER model right. The only correct part of that post was the Hallicrafters brand. I was thinking of the R-274/SX-73. I should have looked it up before hitting "post message."

Never saw this before. Drake, Collins and Heathkit all used the RCA phono
socket for low impedance antennas. The recievers that are 600 Ohms or so
used a terminal strip. There may be exceptions, but that's what they are-
exceptions.

Ted, do you have a manual for this thing. If not there
is one on-line at:
http://bama.edebris.com/manuals/drake/r4c/
Probably pretty low res. There may be a better one
somewhere, a Google search should find it.

Ted -

In addition to Chuck's suggestion -- you will find that SOME of the phono
(RCA) to BNC adapters are a "bit wide" and crowd the phono jack for the
Speaker. I have 2 and I use the narrow one on the Drake R-4C.
====
To answer your other 2 questions.
I also operate my Drake R-4C as a stand alone receiver.

The MUTE and PTO lamp jumpers are needed -- when the receiver is NOT paired
with the matching Drake TX-4C.

The MUTE is "open" when the TX-4C transmits and closed on receiver (hence
the need for the jumper).
PTO Lamp is "open" when the TX-4C PTO is being used and closed when the
R-4C PTO is being used --- in a transceive configuration.

Now, you will find some operators solder a wire jumper inside the receiver
(a practice I discourage -- and had to remove from this estate item). These
jumpers are very easy to make. I use a blank RCA plug - solder a wire to

center pin then wrap other end around the location designated for shield or other conductor -- very neat.
====
Lastly, you also need the jumper plug in the noise blanker socket -- IF it is not present. Again, the OM that had this receiver before me soldered the jumper to the bottom of that socket (bad form).

You have two options for the 7 pin plug. You can purchase Don Garrett's (WA9TGT) solution
http://www.wa9tgt.com/Drake_R4C_4NB_Plug.html

OR purchase a 7-pin plug with screw on back from Leed's Radio (Brooklyn, NY) and wire the 2 jumpers inside that plug.
7-pin miniature plug - Fits sockets for 1L6, 6AU6 etc good for making tube adapters and test jigs with screw on back shell - NOS $4.00
http://www.leedselect.com/parts-sockets.html

New Drake blue filters?
http://www.wa9tgt.com/Dial_Filter_Page.html

or very well stocked hobby shops in .01 and .02 plastic sheets

Scott -

Where is the empirical or engineering data to support this conclusion?

Collins did do the frequency sweeps -- and it out performed many of the
alternatives at that time --
if it didn't Art Collins would have never used the connector (BNC was
available at the time).

It appears the unit may have trouble as a receiver.

According to the record on BAMA an R4-C is a "remote VFO."

Don

I would get a good copy of the manual you need - Bob Sherwood has good
copies as well as a couple of the other manual suppliers (be selective).

BTW, there were 4 major changes during the Drake R-4C production run.

Wayne Montague, VE3EFJ compiled this information (below) and believes it to
be accurate, BUT not necessarily a complete dossier on the Drake R-4C
changes over its entire production run.
This is his latest update.
a.. R-4C ser no above 16121
Revision date - Feb 1973
All mixer tubes 6HS6. First and 3rd mixers cathode injected. Second mixer
is a dual gate MOSFET. The IF chain following the first crys- tal filter is
6BA6 1st IF, Noise blanker and then 2nd mixer. 4 posi- tion filter select.

b.. R-4C ser no above 18726
Revision date - March 1974
All mixer tubes 6HS6. First and 3rd mixers cathode injected. Second mixer
is a 6BE6 with a JFET (2N5949) buffer. 5 position crystal filter selection.
3 diodes in series across the S Meter to compress the meter range. 2 S Meter
zero pots were employed - one internal and one external.

c.. R-4C ser no above 21000
Revision date - Nov 1974
All mixer tubes 6EJ7. First and 3rd mixers grid injected. Second mixer is
a 6BE6 with an JFET (2N5950) buffer. 5 position crystal filter selection.
Some intermediate models in this transition period may not have installed
the new tapped IF transformer, T7C.

d.. R-4C ser no above 25900
Revision date - Jan 1976
All mixer tubes 6EJ7. First and 3rd mixers grid injected. Second mixer is
a 6BE6 with an JFET (2N5950) buffer. 5 position crystal filter selection.
T7C IF transformer. Very little electronic difference to the above model
except a 125 volt zener diode at the junction of R12 and R13 (regulated B+
to the plate of the 6BE6 mixer).

This could be the latest model in the series before production was halted.
From the schematic, the differences between this model and the 21000
previous is little.

NOPE, typo at BAMA (someone left out a 'V').

The Drake RV-4C is the external VFO; the Drake R-4C is the HF receiver.

Say, didn't the Heathkit "lunchbox" AM transceivers use RCA phono
connectors as an antenna conection? Those lunchboxes operated into low
impedance 50 ohm loads all the way up to 148 mcs.

Thanks to everyone for all the suggestions. I ordered a phono plug
adapter from Universal Radio, downloaded a manual from BAMA, ordered a
7-pin adapter from Don Garrett and scrounged some wire and phono plugs
to make the jumpers. Hopefully this should give me something to do over
the holidays. Looking forward to getting this rig fired up. I also
scronged a 3.2 ohm motorola speaker from an old police unit which
should work fine as speaker. Thanks again and Hppy Holidays!!--Ted

Ted --

I am using an old metal Motorola speaker (circa 1961 - gray and black - 5
years younger than me)
in very good condition on my Drake R-4C -- it sounds very good.

The rubber on these old cords are brittle -- so I replaced it with new 18-2
lamp cord (black) from the local hardware store (Ace). Reinstalled the
Heyco strain relief, put a new Switchcraft phono (RCA) plug on the end of
cord and hooked it up !

Source record: 10140

It should be stated that the PL-259, a favorite of the ham world, is not a constant impedance, either. Some hams go nuts if they see you use one of those on 2 meters or higher. However, it is simple enough to calculate the impedance bump at a particular frequency simply by determining the impedance (using the ratio of diameters and the length of the connection), then determining what that bump is at a particular frequency.

I did that once, to show a friend that he should not lose sleep over the connector. It is like inserting a 1" length of 75 ohm coax in a 50 ohm line. Remember that 50 ohm coax is not necessarily 50 ohms. It is a nominal impedance, which means it might be 50 ohms, or 52 ohms or even 53 ohms. So, if you are worried about the connector, you should measure the coax to see what impedance you really want.

RCA and GE both used RCA connectors (commonly called phono plugs) at 450 MHz.

Look at it as a simple tube... look at the outside diameter of the shield
and the inside diameter of the center conductor and plug and chug using
the formulae in the ITT Radio Engineer's Handbook for coaxial conductors.
You get something around 95 ohms characteristic for the front part of the
connector (from the insulator forward). The back part of the connector
is less important but ou have an additional discontinuity from the ring
around the insulator.

>Say, didn't the Heathkit "lunchbox" AM transceivers use RCA phono

Yup! And the truth is, you can away with pretty lousy connectors in
most antenna applications. But put a pulse generator and a scope in
place of the transmitter and you'll see discontinuities at the connector
points.

PL-259 _is_ constant impedance, it's just not exactly 50 ohms. But it's
closer to 50 ohms than the RCA is.

Not to mention measuring the antenna! But with coax, the number in the
manufacturer's catalogue is probably correct (but in a lot of cases it
is NOT the same as the number in the Radio Guide!)

This is undubtedly true- also for type UHF or type F. But why is a contant impedance connector important for an antenna input at HF? Or anywhere in an HF receiver? Even in a critical mixer application optimized for 50 Ohms, the small discontinuity at HF from an RCA plug is of no real world concern.

Anyone have a spare copy of the Student-Experimenter pamphlet GR Pub.
STX-107 "The Universal Impedance Bridge"? I'd like to get a copy, scan or
the original.
tnx

Both in working condition and cosmetics from fair to good, please email me for more details and pics if interested. I will not ship these radios, pick up only in central NJ. Asking $75 for one and $100 for the other or take both for $150.

... go up in frequency to land-mobile VHF and UHF and look at what GE and
Motorola used for the optional pre-amps -- RCA (phono) jacks and plugs.
This gets covered about every 18 months or so on the Collins list as
newcomers -- make these pronouncements.

I like the audio hobby with $ 40 Cardias caps for RCA jacks.

Oh, _yeah_!

I'm mildly tempted to sell a 3-wire power-grade equivalent of open-wire
line, with ceramic insulators, for the betterment of my pocketbook at
the expense of the audioph00ls. Make it out of #6 AWG solid copper, with
an insulator every 6 inches or so, and market it as having carefully-
controlled impedance at power-line frequencies. Yeah, that'd work -- and
buzzwordifying the ad copy would only improve the sales.

BA relevance: #6 AWG solid copper makes _sturdy_ Moxon rectangles at
2m and 6m, though it's a bit big. At 140 cm and 70 cm,
#8 or #10 are a bit easier to work with.

You are correct on the resistor order. This agrees with an SW58
schematic I found.

4405. hallicrafters s-40a, bad band(s)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-22 20:10:12 UTC
From: ablebravo <aburnham@triad.rr.com>

Source record: 10055

this is the first more complex (than s38s) halli have i tried to repair. as received, the set. set played, but w/out sensitivity or vol. recapped (not micas) and tested all tubes, replacing as needed. checked resistors, and replaced a few. set also had severe crackling which matched 'short in a tuning cap' as described in marcus and levy. i replaced the tuning condensor, due to remaining crackles i simply couldn't get out w/cleaning. crackles went away w/partswap and set appeared to align well -- used scope across output to voice coil. got good volume and nice waves as i went thru the IF and the band steps. for IF the sig gen was connected to the center of the gang, the middle of 3 posts on the top of it, w/the ground to the chassis and the gang fully open.

radio plays well on band 3 -- good vol on strong station, many stations w/short wire. picks up similarly on band 2 down to about 4 mhz.

bc is silent except for what sounds like a couple of spots that 'want to be' stations. very faint voice heard in one spot. band 4 seems to be similar.

a quick reattach of sig gen, and good tones heard all bands at align freq for those bands, and good IF tone. bandswitch was checked and cleaned. seems to be making good contact w/clean click/pop as changed w/set on. a little puzzled where to look because of this.

docs say make sure the image freq is out of the way of oscillator freq for bands. i don't quite understand what this means, or how to be sure they aren't colliding, but i think i may have misaligned the base IF? maybe aligned with an image of it? have noticed when aligning other sets, you can find several positions that ring w/the tone, but only one that rings best. is this the result of getting the echo instead of the original? care was taken on the rf aligns to find thru most of the adj range for the best response. but did not try moving the if's radically.

First, carefully clean the band switch wafer metal wipers with a cotton
Q-tip and some DeOxit.
No need for heavy handiness here -- just good patient (methodical) cleaning.
IF you are short on time or not patient that day -- do something else and
come back to it.

have done, 3 times, just as you say. the fingers seems to make good
contact (rise and fall as the switch is cycled). i can certainly do
again. i guess what i don't get is how i can get a nice signal thru
w/the gen -- tune the test signal and its images, but not tune
stations. i don't have a whole lot of experience w/this.

Perhaps you are simply trying to receive stations on bands for which
there is poor propagation during that particular time of day....

I believe your antenna coil is open...Look at schematic and find
BC band coil,check continuity from ant post to ground... coil is
probably open..This sometimes happens when lightning sends a surge via
an external antenna,burns out the ant coil on the band that is selected
at the time..You may be able to repair the coil if that is the
problem...GL HS

checked against a zenith transoceanic, same bands same time of day. i
guess a better phrasing would be, 'could misalignment (image maybe)
cause these problems. i will check the coil, but suspect ok. before
pulling the old tuner cap, could receive bc outside the areas it was
crackling on.

ANNOUNCING the SALE of INTERNATIONAL RADIO
http://www.qth.com/inrad/

George, W2VJN and Georgia are pleased to announce that effective January 1st, 2007 International Radio will be under new ownership. We wish to thank our many customers for their business and friendship over the almost ten years we have owned this company. We have learned much and worked hard, and it has all been good, but it is time for us to look ahead.

International Radio will be in the very capable hands of new owners Trey, N5KO, and Mark, AG9A. Trey and Mark are dedicated radio amateurs who appreciate all aspects of this hobby - especially contesting! They have ideas for the future, and they will not only sustain Inrad; they will improve it. We look forward to helping them succeed in any way we can. In particular, George will stay involved in the development of new products.

For more than two years we have been assisted by Laurie, our employee extraordinaire. Many of you know her and we know you join us in thanking her for her hard work and dedication. We will keep her as a valued friend.

Our final day in business will be December 15th, 2006. International Radio will then be CLOSED until January 1st, 2007. Online orders will be gladly accepted during this time and fulfilled when we reopen in January. Watch the website for the announcement of the annual New Year's Day Sale.

George, W2VJN

Well if you removed visible tarnish (brown or black) you are then
likely okay in that department.

You have performed the alignment, right?

Yes, after I reread your first post -- you may have aligned this incorrectly
Bruce McCalley has a good article on this subject for restorers
http://www.antiqueradios.org/gazette/align.htm

OR it may be ....
http://www.burnyourbonus.net/rec.radio.shortwave/thread306.html

http://bama.sbc.edu/hallicra.htm

I would suggest looking at these S-40A web pages (and owners who have also
performed major restorations and alignments on this model)

Phillip I. Nelson (a good documentation restorer)
http://antiqueradio.org/halli02.htm

VE7SL
http://imagenisp.ca/jsm/s40.html
"A close inspection of the BFO circuit indicated a previous but unsuccessful
repair attempt. As the Hallicrafter's engineers often liked to do in BFO
circuits, a gimmick capacitor consisting of two short twisted wires was used
to couple the BFO signal into the detector. This particular S-40 had one of
the two wires soldered to the correct tube pin but the other one (to twist
together with) was not to be found. Examining the tube pin showed no
indication that there ever had been a second wire as the solder was smooth,
original and undisturbed. The one wire that was installed showed no
indication of ever being twisted with another. It is likely that the BFO
circuit on radio 12,733 never did work, right off the Rogers Majestic
assembly line in Toronto.
Perhaps it was wired or tested very late on a Friday afternoon, back in

1947! "

This last means to make sure the local oscillator is on
the correct side of the signal, that is, make sure you are
not peaking up the image of the desired signal. This is most
likely on the top band (band 4) since image suppression will
probably be adequate to prevent it on the lower bands. The
oscillator of the S-40 and S-40-A is above the signal
frequency on bands 1,2,and 3, and below it on band 4. If you
have the oscillator on the wrong side of the signal the
sensitivity will be low and the frequency calibration off.
You can measure the oscillator frequency with another radio
with similar frequency range, just pick up its radiation on
the the receiver. You don't need anyhing too accurate, just
enough to tell within 455khz of where the oscillator is.
This problem is very unlikely on the BC band but might well
be the problem on band 4. Another receiver will also tell
you if the oscillator is weak or cutting out at some points
on the band.
Since you know the IF stages work OK the problem is
isolated to the RF or Mixer stages. You can probably check
the mixer by injecting a signal directly into it. Probably a
wire wound around the tube (with shield off) a few times
will get enough signal into it. It won't be as sensitive as
normal but should give you some response. If this seems to
work OK the problem is in the RF amp.
Someone suggested one or more antenna primary coils may
be open. This is possible and does not have to be damage
from lightning. Its easy to check, just put an ohm meter
across the two antenna terminals on the back of the set
(with the ground link open) and measure the resistance. It
will vary with the band but should be pretty low for all. If

the coil is open you will get an open circuit indication on the ohm meter. Sometimes all that happens is that the solder connections at the ends of the coil have opened up. Often just heating them with a little extra solder will fix the coil. Lightning damage is usually pretty extreme and easy to spot.
It sounds like you have a service manual. You might check the manuals available on the BAMA site, there are several covering the S-40 and S-40A. While there are differences the two are enough alike so that the rather complete technical manual for the S-40 may be of some help. I would download everything there that pertains to this receiver, there may be a hint in one that is missed in the others.
BTW, I am surprized that it was necessary to replace the tuning capacitor. Variable capacitors are usually noisy due to dirt between the plates or intermittant ground connections to the rotor. Lubricating the bearings with a tuner lubricant may also help. Make sure the replacement capacitor isn't going open at some points.
See if any of this helps. You can also contact me via e-mail if you want. The first time you will get a spam blocker message. I will also follow this thread in this group and respond here if you prefer.
Good luck in restoring this thing, its a neat little receiver.

yep using bama copy halli s40a service guide. have sams. reread phil for first 4 sets i did. will read bruce w/interest, but some over my head. think i will retry if align since cleaned band again w/no change. band rotors look pretty good. have located the band 1 related coils and will try to figure out how to test for opens....4 solderpoints per coil.... not sure which should be connected to meter.

thank you all for your patience and advice

Richard reminded me of one other point .. check you coils in the BC (band
1).

Phil found bad capacitors in some of these sections or inside cans (great
way to ruin the day) ...
finding and replacing resolved his sensitivity and peaking.
Note that many have commented that sensitivity was lousy (compared to what?)
on band 1.

gb

thx richard. esp on how to test the coils. i will do that before checking the IF again. i am suspecting the IF because a couple of the adjustments were near the travel limit, which may mean i am in wrong place. where it works, it's hot.

i was pretty sure on the tuning gang -- could adjust the vanes and get the crackle to change and nearly disappear. i flushed it good, blew it out and cleaned and cleaned. after spending hours on it, i bought the part. i think something might have been in the bearings. in the 'crackle spot' the signal died and set could not be aligned. it blotted out some of the align freqs. no such prob w/replacement part.

Do you have a signal generator of some sort? I thought
from your posts that you do. You really do need one to set
up the IF amplifiers. It should be capable of putting out
455 khz preferably with some modulation. The usual
requirement is for 400hz at about 30%. The modulation level
is not critical but most signal generators are not capable
of high modulation level.
Its also helpful to have a crystal calibrator, preferably
one which puts out fairly low frequency markers in addition
to higher frequency ones. 10khz is nice to have. Mine has
100khz, 1.0 mhz, and 10mhz. This can be used directly to
calibrate the receiver and also to calibrate the signal
generator. If you don't have these tools perhaps you can
borrow them.
If the IF transformers are near the limit of their
adjustment, and you know the test frequency is correct, its
probable the resonating capacitors have drifted in value. I
believe this receiver uses permeablility tuned IF coils
(asjustable dust cores).

Again, since the problem seems to be isolated to two bands and at least one band works OK I think the IF is not at fault, or at least not the main cause of trouble. I suggest checking the wiring of the tuning capacitor again to make sure its OK. You might want to check the other capacitors in the oscillator and RF stage. I am suspicious of the oscillator because you say it quits near the low end of one band. That sound to me like a bad coupling capacitor there. If you have access to a good RF voltmeter or reasonably wide band oscilloscope you can check the output of the oscillator. Even a pick-up loop will show if the output is varying a lot or if the LO is quitting at the low end of a band.
Just some things to look for. Remember, this RX is more than fifty years old so it may have a lot of tired parts (so do I).

thanks again, richard. i am printing this whole train out to go down
everyone's checklists. yes, i have an eico sig gen,almost as old as
the set. i check it against an aor 8200 scanner set for the target
freq at each alignment. it is usually really close to right on the
money. have an old tek 465b 200mhz, which is still something of a
mystery, but i can use it in simple ways. i think i can find the
output. tube-tested the mixer/osci tube itself, and again got ok.

have also an eico signal tracer, but have only read a bit about how to
use.

i do plan to check the tuning cap wiring. i did redo the solder
joints, and while i did photo and mark the wires as the old came out, i
could have made a mistake. it should be easy to undo and jumper to
check -- mistake would have to be in center gang area. wires not long
enough to grossly change where they go.
it will take me a while to go thru all this -- thank you all.
ab

Here is a Viking I transmitter in very good condition. It has not been used in many years.....I have not fired it up because the caps probably have to been replaced and look original....All the parts are intact and since it has not been fired up and I do not have the manual it will be sold as a parts rig...I can send you digital shots if needed...This will be a pickup only and will not ship....I'm located in Lakeville, Ma. about 35 miles South of Boston...I will take $200 and would make a good restoreable project for the Winter.....I can be reached at (508) 821-2993 or email....WZ1U Steve

Long thread snipped...

If you need a handbook for the Tek 465-B there is one on
the BAMA site at:
http://bama.sbc.edu/tektroni.htm
And for Eico instruments at:

http://bama.sbc.edu/eico.htm

This is a very good site to bookmark.

The signal tracer is a wide band amplifier with a
detector on it. You can probe around in the circuit to find
out what is there. That and the scope are powerful tools for
analysing exactly this sort of problem. You can use the
scope with either a high impedance probe or a simple pick-up
loop to look at the oscillator output. The look will cause
the least disturbance to the circuit you are measuring.

i think you have nailed at least part of it -- rf stage. i have
emailed you offline details. had a completely dead rf amp tube, ahead
of the IF stage. this apparently forced a pretty severe tuning
compensation that affected the bands (?). all tubes tested before
starting work, but this one croaked sometime during repairs. found
intermittent black speaker lead and fixed. was cutting out also. so
there's some of it. already better w/if and bfo align redone. will
see what gives after i finish all rf again... hopefully it will come
back into line on all bands. yes i go first to bama for all.
bookmarked on about 4 computers i have.

4430. R4-C dial calibration

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-24 05:44:12 UTC
From: tjbitt <tjbitt@ntelos.net>
Message-ID: <1164347052.797154.52010@m7g2000cwm.googlegroups.com>
Source record: 10080

Hi all, got another Drake question. I got my R4C on Wed and it appears to be in working condition but needs some work. It appears the freq dial readout is off by about 65 khz. CAn anybody tell me how to align the plastic freq dials so they correspond to the received freq? Is there a way to crank the tuning dial all the way clockwise to the bottom end of the band and realign the the 10 khz and 100 khz dialfaces to 0 and 0? I took the tuning knob and skirt off but didn't have a pair of split ring pliers to remove the split ring cliparound the tuning dial shaft?. Am I completely off or is this an alignment problem. I was told the alignment was well within specs.

Another problem appears to be the the R4C is only operating in AM mode when I switch over to SSB the receiver mutes with no signal heard over the speaker its like it is completely dead. Not sure what this could be but makes the rig useless for SSB or CW monitoring. Again any thoughts would be most appreciated I have no friends or elmers to help locally. Thanks again. Ted---KQ4mz

I just picked up on this thread and read it with interest. Sounds like you're on the right track. That's a nice receiver when working correctly.

One thing I'm beginning to appreciate about fixing old radios & TVs is that some components which test "good" or seem acceptable at first, may decide to give out after a few more hours of operation. The tube (or whatever) may simply have reached the end of its service life, or perhaps it croaked after running at full power for the first time in decades.

Before I declare victory on any project, I run it on the workbench for some hours. Much better to find and correct those latent issues now, rather than later.

Have fun,

Phil Nelson

Its possible for tubes to have bad seals or very slight
cracks that allow some air to get in. The "getter", which is
the silver stuff on the inside, can absorb only so much air
after which the tube will simply not operate. Sometimes the
symptom is a blue glow inside the tube, something like the
glow in a voltage regulator tube. This should not be
confused with the slight dark blue glow somtimes seen in
beam power tubes with very high voltage on the plates. This
is not due to air and is normal.
It is also pretty common for resistors and, especially
capacitors, to die after being unused for a long time. There
are many causes, moisture absorption and others. Even
transformers may die shortly after being fired up after
being unused for a long time.
A useful tool when working on old equipment is a metered
variable transformer. Ideally, it should have both a voltage
and current meter on the output. The current meter is

especially important since it will show excessive current before damage is done. My suggestion is to remove rectifier tubes from the equipment and bring it up slowly on the transformer. If there is any sign of excessive current turn it off immediately. If it looks OK this way try again with the rectifiers, again bringing the voltage up slowly. Of course, the filter capacitors should be checked first for shorts.
Most electronic equpment likes to run. Leaving it off and in storage for long periods is not good for it. I suspect nearly everyone who follows this group already knows all this stuff.

4433. Using the 75S for swl'ing

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-24 22:11:11 UTC
From: Bret Ludwig <bretldwig@yahoo.com>
Message-ID: <1164406271.034249.152590@45g2000cws.googlegroups.com>
Source record: 10083

The Collins S-line is not exactly ham band only. If you have enough crystals you can have any 200 kHz, I think, of Hf spectrum between 3.4 and 30 MHz except for 5 to 6.5 MHz.

Using a remote RF gen with programmed steps instead of the xtals is possible with only minor modification, I think. But perhaps an internal synth would be possible, and could be made quiet enough to not detract from the superb performance, better than most synthesized icoms and so forth.

I'm told that for specific 200 kHz swaths, a 75S or KWM is a much better receiver than the 51S-1, which has a very promiscuous front end.

Any thoughts?

Bret, I can't fully agree with you on several points. The KWM and 75S receivers are pretty good but so is the 51S1. The 75S-3B/C are arguable better when tuned properly and in good electrical condition and in consideration of the available filters. The problem with SWLing, so to speak, is that although movable (read: re-tunable) throughout the HF spectrum, both the KWM and the 75S receivers require an "internal" retuning to maximize sensitivity when the excursion is made outside an adjacent 200 kHz segment. You'll note in the manual a reference to a "field alignment". This is required when shifting a noteworthy amount. The KWM and 75S have limited re-tuning ability via the front panel (preselector). The 51S1, on the other hand, has a fully tracked tuning system throughout the HF spectrum. Price aside, and given a choice of the two types of receivers, the 51S1 would wins hands down, in my mind, as an SWL receiver. Frankly, though, I'd prefer and in fact use, among others, R-390As or a Drake R4C (or "B") and an S&S DVFO-II. But, that's why there are Fords, Chevys, and Toyotas.

Hi,

I have an S/Line, KWM-2 and a 51S-1. The 51S-1 front end is fine
if it sees 50 Ohms. It has a double-tuned front end which is quite
selective when used with a proper antenna.
If you must use a random wire antenna with a 51S-1,
even an untuned preamp such as an E.F. Johnson electronic TR switch
will help the front end perform as designed.

Below 2 MHz, the 51S-1 is insensitive, and was intended to be used
with an external antenna tuner/ source follower for 50 Ohm input
to the receiver.

My only gripe against my 51S-1 is that the S/meter zero
drifts quite a bit, and I don't look forward
to chasing down a possibly leaky coupling capacitor
in the IF circuit.

73,
Ed Knobloch

Hello Ed:

I had a similar problem and I kept looking in the wrong spot. I assumed it was a leaky cap and replaced all the caps and tubes. Finally, out of desperation, I convinced myself it had to be something else. About that time I was reading about resistors. The carbon composition resistors are often absorb moisture and change resistance when heated. Changing to a newer more stable resistor solved the problem. I think there is a chance you are affected with the same problem.

I'd read the 51S was pretty broad on the front end, so much so that
selectivity from signals at various points was pretty low. I have
never seen one,actually. I have seen LOTS of KWMs and 75S-3s.

What advantage do purpose built VFOs have over generators like the HP
8656B, which can be had cheap if you will accept the rear-connector
versions? (I don't know why you can't just drill a couple of holes in
the front panel and put BNCs on and make up a couple of new cables
internally, for the huge difference in price, either, but that's
another story.)

4445. FS: Hallicrafters ARR-7, ARR-7AX Power Connector

Purpose built VFO's, as you call them, generally allow for presetting an offset or offsets such that a "dialed-in" frequency reads out directly in the use frequency rather than the actual mixing or insertion frequency. Additionally, as with S-Line equipment, etc. that use band-dependent, multiple mixing formulas, multiple offsets may be set into VFOs such as the S&S unit I mentioned. Cost wise, they probably cost the same initially but I'd hate to have to pay to repair an HP. I personally have not experienced the front-end problems as you describe, but then I generally use my R-390A's. The 51S1AF/551G sort of sit on the shelf, looking pretty. I did an article on general-coverage for the Drake "C" line via a purpose-built VFO in an ER article last year. You might, perhaps, be interested in having a look at it.

I think ER is a noble effort but it's a little expensive for someone
who is not actively hamming.

The S&S I'm not familiar with but I remember AOR made the dual section
vfo that replaced both the xtal section and the pto on S-Line. Looked
vaguely like a tiny S-Line. I guarantee it would be no cheaper to fix
than a synthesized HP if you were not too concerned with the precision
of the attenuator of the HP. In fact if you can get a 8656A that was
not field upgraded to the PIN diode attenuator, and the mech attenuator
went bad, (they do) I doubt it would bring more than a hundred bucks.
Use it straight through at +13 or +17 or get the little rotary stepped
job IFR uses in the 500/1200. I knew a guy who worked there who
summarily changed every one he worked on for over a year : he gave me
half a dozen and said they were all good under 400 MHz. IFR charged a
couple hundred apiece but they were like $60 from the source, maybe
Berkleley Varitronics.

IIRC the 8656/57 have 100 preset frequencies you can program in, so
you just use it channelized, since you only need to select for the
"band".

The limits on fixing 8640s is the presence of some HP custom IC's. I
have no idea if there are proprietary ICs in the 8656/57. In general
fixing HP equipment is easy. IFR is a mechanical nightmare but
electrically simple. Systron Donner-throw it off a cliff!

Someone suggested that the newer generation of arbs had the frequency
range and level to do the job and as well most are USB controllable. I
don't know if their spectral purity is good enough though.

The R-390 is the Marilyn Monroe of HF radios, though. Isn't it?

HiEd:

I recall I changed all of the resistors that were part of the bridge circuit. I am not very good at keeping notes.

The new digital meters are nice to test components. Put a resistor across the DMM and use a hair dryer. Works great when testing capacitors using a capacitance meter.

I have one, an SX28A, out of the box in as new cosmetic condition. I bet all the caps need replacing though. It does work but seems to be a bit deaf. Bought it 40 years ago from a guy that bought it new and never used it. I fired it up 10 years ago and again last week. It's still deaf but it looks really nice. Offers?

Ted -

The Drake 4-line is now over 30 years old -- and requires proper maintenance for reliable operation. Unfortunately many Drake items being sold on eBay these days are either from estates or former CBers operators -- with had no technical knowledge, BUT used golden screwdrivers on the equipment -- when problems occurred.
I picked up a Drake R-4C from an estate earlier this year -- and I have spent considerable time (2 months) cleaning and deodorizing this receiver (former owner was a heavy smoker).

This R-4C now looks and smells like it should -- and will complete my work this winter (minor issues - since this receiver was obviously used daily) -- before I send it to Jeff later this winter for a full alignment.

I would recommend sending your Drake R-4C to Jeff Covelli (WA8SAJ).
http://www.wb4hfn.com/DRAKE/DrakePartsService.htm

Pack the receiver well and enclose a list of all issues that you have noticed so far.
After he address the repair issues -- ask him to perform a full alignment on the receiver.

w9gb

I don't think that Cinch ever made stainless steel tube shields. They made Cadmium plated steel and Nickel plated brass shields. Some manufacturers had them Chrome plated.

Source record: 10012

I am selling my Racal RA17L receiver. It is in nice shape. The front panel is almost perfect. The chassis has a dent I think and it is dusty inside. It has those black tube covers. I changed a capacitor in the power supply last year. The guy I bought it from said he had some professional guy work on it - whatever that means.

I paid $400 for it and that is what I will take for it. I just have too many radios.

I will not ship the radio. I am located in Boston area. I travel a lot thru NY, NJ, CT, and parts of PA. I will drive it over to your place if it is convienent for me. You can plug it in and if you like it you can buy it. I only buy that way myself and don't mess with Ebay for radios.

regards,
NEO

Yea, I hate to admit it but bought the R4C from Radiomart. Had never
read anythig bad previously, til I started checking into him further.
The radio truly is in great cosmetic condition, little dust under the
hood, the bottom side of the chassis is clean. The radios main prob is
no ssb and the dial calibration way off. Martyn said to return it and
he would fix it. The more I find out, the less sure I am I even want
to send the radio back to him. It's a bigger waste to pay shipping back
to him and wonder if it will ever be right.

What's the consensus? I think I will take up the suggestion to send the
rig to Jeff Covelli and get it fixed right, and even though I will
spend more than I wanted to on the radio, at least it will be in good
working order and a keeper. The other alternative doesn't appeal to me.
What do ya think.? I sure wished I'd come here first..... guess your
never too old to make a mistake though-----Ted KQ4MZ

I would not return it to Radiomart- who knows what the result would be, or
his skills.
Get it done right, and do everyone a favor and leave negative feedback if
the radio was sold as being in working order.
Dale W4OP

> Yea, I hate to admit it but bought the R4C from Radiomart

This experience is "right out of the book."
No doubt it was "one of the finest ever offered, from my personal
collection, I tested all the tubes, and there are no issues", etc etc.
He avoids negative feedback by offering to let you return it, heard that all
before.

> the radio was sold as being in working order.

The reason you can't is that you then leave yourself open to negative feedback from him in retaliation. And that can be the kiss of death for you. That's the big problem with ebays feedback system.
RM keeps his feedbacks good because he offers to take things back. So he says "Hey what are you complaining about? I offered you your money back."

These are not stainless steel. They are plated.

4482. SX-100 failure

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-29 14:37:31 UTC
From: K7AAY <john.bartley@gmail.com>
Message-ID: <1164811050.964202.304380@j72g2000cwa.googlegroups.com>
Source record: 10032

Given an SX-100. It doesn't work.

Chassis and interior in good shape, no corrosion. Lights fire up when turned on. Attached Hallicrafters 3.2 ohm speaker (or headphones if plugged in) hums, and I hear scratchy noises when I change across the bands or switch to phono. S-meter moves across the dial when I spin the sensitivity knob.

But, it doesn't actually receive anything, and the S-meter does not move as I traverse the bands nor does it change as I move within a band.

Suggestions on priorities for troubleshooting, by tube replacement or otherwise, appreciated. I feel the detector is the place to start? Have a multimeter, is all. In Portland (OR) Metro area.

0A2 voltage rectifier $6
5Y3GT rectifier $10
6AU6 1st mixer & crystal cal (1 ea) $10
6BA6 1650 KHz IF amp, 2nd mixer, 50.5KHz IF amp (1 ea) $8
6BJ7 detector/AVC/noise limiter $5
6C4 1st conversion oscillator & KHz IF amp (1 ea) $13
6CB6 RF amp $5
6K6GT audio output $8
6SC7 audio amp/BFO $9
12AT7 2nd conversion oscillator $13

Your Elmering would be appreciated. Thank you in advance.

1 Check power supply voltages
2 Audio output
3 Audio Driver
4 Detector
5 IF amplifiers
6 Make sure oscillator is working
7 RF amp

Sounds like a good candidate for a paper cap replacement party.

You'll need a signal generator to inject a signal into the various stages.

A VTVM or scope can be used to see a positive voltage on the grid of the
oscillator tube to determine its working.

oh yeah, I forgot to ask, is the ANTENNA hooked up ?

I have recently acquired a New-Clarke AM Field Intensity Meter. I have been searching for documentation and have come up with nothing. I think I have Googled my fingers off! What I see is that the meter is similar to the 120-E except that this one is all transistorized. It appears to work although it would need calibration. If nothing else, it makes a really cool looking radio! Anyone know of a source for documentation?

Ted mahler

Maybe, or something before the detector. You really, really want a scope.

If you don't have a scope, you can make the assumption that what has gone bad is _probably_ a paper cap somewhere in the IF strip or detector, and just shotgun all the paper caps out. If it turns out not to be a paper cap, you haven't wasted your time because sooner or later one of them will fail.

The second thing you can do is measure grid, plate, and cathode voltages on each of the tubes on the IF strip and detector stage, and see if any of them is way out of wack. If you see 200V on a grid, you have a DC blocking cap issue. If you see 10V on a plate, you have a plate resistor gone open. If you see 200V on a cathode, you have a cathode resistor gone open.

It's a lot easier with a scope and a signal generator because you can run signal in and trace it step by step with the scope, so you can identify the offending stage before you start poking around with the meter. This saves a lot of time.

It's almost certainly not a tube. Tubes fail sometimes, but resistors and capacitors fail more often. I would make sure all the filaments are lit first, of course.

If you don't have the manual, you should download it from the BAMA Mirror
site.

Read through the Test section and set all switches, pots, Band Switch,
frequency, etc to what is directed.

Next, using the page(s) showing the bottom view tube layouts with pin
voltages, measure all the voltages with a VTVM or equivalent and write down
all voltages that are off by more than about 10%. This should provide a
guide to where you have one or more defective components.

Please give a clue about your level of electronics. What town are you in? I'm in Washougal (East about 15 miles on State 14, from I205 bridge). I have a sig gen I may loan you, but can't let loose of my scopes. Maybe later.

Don

4489. Anyone have 1972 QST? Need HW-16 mod article

Newsgroup: rec.radio.amateur.boatanchors

Source record: 10038

I agree with the previous advice. Paper & electrolytic capacitors should be replaced eventually, so why not start now? This article has basic advice about recapping.

http://antiqueradio.org/recap.htm

You can download the schematic & service data from the BAMA site:

ftp://bama.sbc.edu/downloads/hallicra/

I don't know offhand if all of the SX-100 tubes are glass, in which case you can look for duds by simply looking to see whether tube lights up inside. I believe this set uses a 0A2 regulator tube, which will glow purple rather than the usual orange-ish. Don't freak out -- that color is normal.

Knowing that a tube lights up doesn't tell the whole story, since the tube might still be too weak to perform well. On the other hand, if you find a dud or two, you've learned something useful.

You can also check for duds by measuring the resistance of each tube's filament with an ohmmeter. You can look up each tube's basing diagram at Nostalgia Air:

http://www.nostalgiaair.org/

Click on Tubes, then enter the type (for example, 6SN7) of each tube you want to test.

The tube filament is shown in the diagram as little mountain-peak sort of symbol. In a 6SN7 tube, for example, the filament pins are 7 and 8. If the filament is good, you should measure very low resistance between those pins using an ohmmeter. If you measure infinite resistance, the filament has burned out and the tube is no good.

When you say that the radio "hums," if that means a loud, low-pitched hum which doesn't change as you turn the volume up or down, then you have bad electrolytic capacitors in the power supply. Replace those before doing anything else. You should do that anyway, to avoid burning up your power transformer if one of them fails.

If by "hum" you mean just the normal faint background hum from a tube radio, then don't worry about it.

There is a very simple test to tell you whether your audio amplifier is working. Turn up the volume, then briefly touch a turned-on soldering iron to the input terminal of the volume control potentiometer. (That is, the side that is not connected to ground.) If your audio section is working, you'll hear a loud growl from the speaker.

Voltage checks are tedious, but can be very informative. When making any measurements on a powered-up chassis, follow the old-timer's rule of keeping one hand in your pocket when doing the test. This prevents you from getting a shock by touching two hands to places they should not touch (Bzzzt!).

Have fun. That should be a great receiver when you get it working properly.

If you hear noise when changing the band switch try
cleaning the switch and the tuning capacitor contacts. Also,
blow out the tuning capacitor to make sure there is nothing
shorting the plates.

If you have not tested the tubes do so but I think a bad
tube is unlikely.
Do you have any service instruments (VOM, scope, etc.)?
Do you have the service manual? If not there may be a
free one on line somewhere. If you have the book you can
check voltages at the tube sockets, this will often find the
problem or give you a pretty good clue as to where it is.
Evidently, the power supply and audio stages are working.
If you have a signal generator try inserting a signal into
the IF strip. You can often do this by wrapping a few turns
of wire around a converter tube. The SX-100 is double
conversion so there are two I.F. frequencies, again, a
handbook will be very helpful.

I had this amp (sb 220) for several years and it had always worked fine. Moving I put it in storage on my new property and 2 years later when I set up my new ham station...no more 10 meters. All the other bands work fine with full power out. Looking at the band selector it also looks fine not burnt out. The bad thing is I run 10 meters. Any one have an Idea or have come across this problem....please let me know with some testing ideas.

Thanks Sam

I'm not familiar with the amp, so I will give a guess or two. Though you know the switch doesn't look "burned" out, what about oxidized, dirty or slightly pitted to not make contact. How about the wires going to it - any cold solder joints? Wires broken off? Sounds like something subject to the "switch". Any components which may have been placed in line - open?

Try "rocking" the switch around the 10 meter position while trying to get the signal going - see if it makes any attempt to work.

That is as far as I can go with no schematic or knowledge of the amp.

tjbitt wrote:
> CAn anybody tell me how to align
> the plastic freq dials so they correspond to the received freq?

Yes. Put the skirt and the knob back on and remove the top cover.
You'll find a bunch of gears at the front of the PTO (and behind the
knob). The gears are held in a meshed condition with spring loaded
arms. These arms can be disengaged with your finger and you can then
spin the dials freely. Alignment of the dials to actual working
frequency is then fairly straightforward -- although sometimes somewhat
tedius.

The frequency not corresponding with the dial indicators is not an
indication that the radio is "blowd up". The dials are simply not
aligned. This seems fairly common with Drakes that have been shipped.
I suspect the guys at UPS have been playing tackle football with your
receiver.

There are pictures at the following web page (scroll down to the bottom,
Step 5):

http://www.wb4hfn.com/DRAKE/DrakeArticles/PTO/Drake_PTO.htm

> Another problem appears to be the the R4C is only operating in AM mode

Bad or missing filters? Broken wire? Dirty switch contacts?

Sign yourself up on the drakelist email reflector. It's an incredible
resource for anyone with an interest in Drake gear.

http://www.zerobeat.net/drakelist/

BTW, to answer your other question as to how to hook an antenna to an
R-4C, the absolute *BEST* way is to pick up a Drake T4X-C. Then you use
an RCA to RCA cable from the R-4C to the T4X-C and a PL-259 from the
T4X-C to the antenna system. As a bonus, you now have a transmitter!!

There were actually several modification articles in the early 1970s for the
HW-16
CQ and QST - both had articles on the 20 meter mod

Nov. 1968 CQ p.117
Dec. 1971 CQ p. 72
Aug. 1972 QST p.51
Nov. 1974 QST p.20
Nov. 1975 QST p.35
May 1976 CQ p.35

BAMA good source for manuals and schematics
http://bama.sbc.edu/heath.htm

I am surprised that Biz, WD&#65533;HCO (HW-16 guru) -- has not yet posted a reply
to you.

Just about has to be the band switch or the lead from the switch to
the coil tap. Not much else unigue to 10 meters. The band switch is a
known weak point. They can still be found on the internet.

Aside from what other posters have mentioned, there's another area to
look at:

the tuned input coil circuit for 10 mtrs. This is the tuned network on
the input side of the amp. check its bandswitch contact, the input
coil for continuity, etc.

Doug

4503. Stancor 69 and Echophone EC-3 Info Needed

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-11-30 11:19:00 UTC
From: Dale <drc@oz.net>
Message-ID: <tqetm2p2t3ov24t6k4vooqnd10ca9hscoj@4ax.com>
Source record: 9953

Hi,
I'd like to get one or both of these going during the winter months.
I haven't been able to find schematics online for either. My Stancor
69 is kinda odd- it was a kit, but the chassis seems to be welded
to the case. It's complete, but partially disassembled. The power
transformer is burned out. I'd like to get into AM, and maybe this
would be a fun rig for that (with an amp :)

The Echophone Commercial EC-3 is in nice shape, but non-working.
I've found EC-1 schematics, but none for the EC-3. I also need a main
tuning knob for it, but it seems to be the same as several period
Hallicrafters sets, so I'm l'm not so worried about that.

Schematics, info and experiences would be greatly appreciated.

Thanks.

Dale

Sam, all you have said is it is not working on 10. Could you provide a
little more data?
I will help with a little logic:
Are you getting grid current when you drive it?
If no, then investigate the ten meter grid tuned circuit and bandswitch
(good luck, it is buried behind the front panel.)
If you are getting normal grid current, but zero output, then what about
plate current?
If you are getting tons of plate current but no output THEN you could
suspect the bandswitch.

Have you tried contacting Nems-Clarke? As far as I know they are still
around and still making broadcast receivers.

You could also try Orrtronics, formerly Harris-Allied Broadcast Supply's
used equipment division.

Used to be every AM station in the country had one of these things for
the periodic RF proof of performance measurements.

The site you gave is a mirror of the BAMA site. I did not
check what is on the mirror but the main BAMA site has 29
pages of the manual. I think what has been left out are the
construction instructions.
ftp://bama.sbc.edu/downloads/heath/im4100/

I suggest downloading to a folder rather than opening it.
That way you are sure of getting the whole thing.

Thanks. I hope we both get the knobs we need. There should be some
out there.

In a Google search I found a page mentioning a Stancor 69 user by call
sign. Would it be out of line for me to look up his/her name and address
and send a note asking for possible info?

Thanks again,
Dale

HW-16 guru ??!?? - I don't know about that...Naw just like hackin them! It's
a fun radio for messing around, cheap and plenty of them...

Send me your email address and I'll see what I can dig up article wise...

But the real info you need isn't in those articles...

The 19.545 XTAL you need is in a HC-17U holder - 16 pf cap -

International Crystal (800-725-1426) price 3 years ago was $19.95 and 2 wks ship date. Ask for Bernie - This mod is not in ICM's database so they'll gave you a bunch of excuses - tell um what your doing - if that don't help - mention my Name WD0HCO Bismarck Wichy and you want to order the same 19.545 XTAL he did...

Do NOT order through their website... ICM, like most others has lost all their experienced help - they do know about clocks in Micro's but the radio XTAL business has dried up and most of the old timers have left.

FYI's... the receiver can be made to go just about anywhere - sensitivity drops out about 25 - 26 Mhz so you can use an MRF-102 to peak things up a bit on 10. 30 mtrs would also be an excellent choice - especially during contest weekends but finding odd ball 5.05 mhz FT-243's will be a pain.

Transmitter mods - final coil - some articles had you take a long nose pliers and count the turns and pull out wire to solder your tap. Too much trouble!

Unsolder the taps and completely take the coil out and un-roll the wire. Replace it with 18 Ga plastic insulated wire (Your choice of color!). Lay this wire straight on the floor and measure out your 18 ga wire to the same size. Scrape the insulation at the taps points and tinned them. Add a little twist to make a loop and rewind on the coil form. Re-install and solder the tap wires to it. Works just as well but looks much nicer.

Have fun! Biz WDï¿½HCO

Do you ever post anything positive?

Your posts aren't worth posting to the five boards you are boring to death.

I like CW so don't throw any of your nonsense my direction.

While I'm at it, it's not very smart to post a message responding to someone
without quoting them.

Looking again to obtain two pairs of cushions for some HS-23 headsets (R-14 elements). I'd like 2 pairs of either the chamois type or either of the smaller, rubber types. Fair Radio has some repro NAF-type chamois cushions, but they don't have the element insertion channels molded into them. I'd rather not use them unless absolutely necessary. Used cushions are certainly OK if they are completely serviceable. Thanks much de K3HVG

Source record: 9980

OK, here is a question...

Around here, I seem to see only a few models of radios at any one time. Moxy is one I've not seen and as such am not familiar. I bought a "used" Moxy for "possible" use. It transmits ok - but no recieve audio. Now, I am wondering - if there is a PL reed which could be blanking out the audio? OR is it done by programming - some how?

I didn't look "too" closely to see if I could spot a "reed" - as it was late and my eyes weren't cooperating too well. I can look again.

I am betting (hoping!) there is PL involved - but in case there isn't - anyone have a manual I can get a copy of the receiver section schematic from? This radio is currently on 47.50 MHz. I am not real sure I am going to keep it. I "thought" about putting it on our fire band, but we "may" be going VHF high - soon. Could always <maybe> use it too - for a 6 meter link on the repeater! Then too, I could always sell it - it is in decent shape - aside from the issue stated.

You Earned that right too, when you passed the 20 wpm code test, and
you should flaunt it around like I do. Here are some ideas I like:

No-code hams should have to stand up salute when you walk into a room,
even ones in wheelchairs.

You get to sit in a chair at club meetings and if all the chairs are
taken you can make a no-code or nickel ham sit on the floor.

First in line for the refreshments, ahead of the 13wpm hams and the nickel
hams is always nice too. Don't forget your cattle prod.

73 to you my extra class friend, you earned it. Everyone else these days
just wants a welfare handout license.

> is it done by programming - some how?

The Moxy was an 'entry-level' version of the Maxar series. I used
to work on both years ago. They're crystal-controlled analog-only
radios, no programming or microprocessors involved at all.

Some radios either did not have an internal speaker, or required a
jumper between two of the contacts on the rear Molex-type connector to
activate the internal speaker. There should not be any PL muting going
on unless the radio has a microphone hangup box, with the appropriate
switch, wired into that same Molex plug.

> I didn't look "too" closely to see if I could spot a "reed" - as it was late
> and my eyes weren't cooperating too well. I can look again.

There were two different versions of PL board. One did indeed use
the standard 'Vibrasponder' type reeds, but the newer boards used a
custom IC and pluggable tone filter element. Said element consisted of a
series of precision resistors, imprinted on a ceramic substrate and
laser-trimmed to the desired value for the PL tone required.

There was still another board that provided DPL - Digital Private
Line. It also used a ceramic module, but they were much simpler in that
they're just conductive jumpers, the pattern of which determined what
code the board would generate and respond to.

The tone filter plugs can be difficult to find. If you discover
that you need to change PL tones, you would probably be better off
putting a ComSpec board in there to replace the factory PL board.

> I am betting (hoping!) there is PL involved - but in case there isn't -
> anyone have a manual I can get a copy of the receiver section schematic
> from? This radio is currently on 47.50 MHz. I am not real sure I am going to

<snippety>

The low-band Moxys are fairly durable, if you don't put them in a rough environment. It would make a fair 6-meter radio, but I wouldn't want to depend on something that old for communications that could affect public safety.

If you do decide to use it, you can get the necessary crystals from International. However, you will need a full service manual, and the necessary test gear, to align and test it.

Happy tweaking.

Alain,
The R-15 receiver, part of the Aircraft Radio Corp. (ARC) Type 12 series of airborne communications and navigation equipment. The Type 12 equipment was used by military as well as civil aircraft, up to and including "cabin class". In its day, Type 12 was considered first-class equipment. The military used Type 12 equipment, to include the ARN-30 navigation series and several AN/ARC-xxx comm systems. Aircraft included DeHaviland L-20/U-6A Beaver, Otter, and Caribou. Cessna T-37 jet trainer (employing a UHF transverter), both civil and military Aero Commander and Cessna 310 (Blue Canoe) used ARC in the early years. T-6's in Korea used Type 12 equipment. I've been told that early P-80's (nee T-33) used this ARC equipment, also. During this period, the ARC equipment was competing with both the AN/ARC-3 and AN/ARC-49 VHF equipment. I'm certain there were other aircraft but these are the ones I have personal knowledge and/or directly associated with. Type 12 equipment was also used in an integrated ground radio package that was used beginning in Korea as a FAC (Forward Air Control) and in mobile control towers. The Type 12 eventually gave way to the ARC-210 and ARN-30D equipment and thence to solid-state equipment by ARC and others. The Type 12 and ARC-210 systems were considered the Cadillac of ARC equipment during the 50's and early 60's. The ARC IN-10 VOR/ILS indicator became a de-facto standard-of-the-industry. After ARC was bought out by Cessna Aircraft Corp., ARC equipment became nothing but consumer-class junk, with a horrible maintenance record. My Type 12 books both from ARC and the military show dates from 1954 through 1960. The ARC-210 book, with addendums is dated up through 1977. All the Type 12 stuff can be wired for either 12 or 24 volts. The books provide filament re-wire instructions so that all one has to do is change the dynamotor or "dynaverter" over to the desired voltage. Although somewhat available, control boxes, connectors, and teleflex cables are the harder things to find inasmuch as most of it stayed in the airframe when it was taken out of service. Finding some types of the racks can also be problematic. Hope this sheds some light on the subject.
Regards DE K3HVG

Hello ,thanks for the answer ,it is very interresting .
The r-15 I have works very well indeed .This afternoon
I recorded and got a small picture of noaa18 on 137.9mhz in
fm , (yes I know it is an am rx),you know those weather sats at about
850km of altitude ,it was at 1000km fro qra when I got it without
preamplifier and with an omnidirrectional antenna!!!Not too bad for this
50 years old radio .Do you know if there are books available on the net
,I looked for it and did not find anything ?
Thanks very much ,73 alain f1gqb

4547. How I got started in ham radio [circa 1954]

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-12-04 01:48:30 UTC
From: W3JLU@webtv.net
Message-ID: <20729-45737E6E-645@storefull-3215.bay.webtv.net>
Source record: 9897

I had this weird friend (later re-named a 'nerd') when I was in 9th grade in high school, who owned a Hallacrafters SX-99 reciever. He also owned a Gonset Communicator, the origional gray one with the usual 2E26 final.

My dad bought both for me and I earned my novice license and went quickly to general.

My chief band was 2 meters and I wound up with a 5894 amplifier (A M) crystal controled rig.

The last reciever I used with that set-up was a National NC-303 with a 417A converter in front of it.

The antenna was an eight ofer eight Telerex set-up.

I got out of school and started working. Ham radio just went away.

I moved to Ohio.

My dad died and I came back to Pennsylvania.

I got an add from the ARRL about re-joining.

I did.

I got back on 2 meters.

I found out that what used to be a "band opening" was now all the time with the advent of SSB.

At first I had a Zeuss 200 watt AM transmitter with another NC 303 reciever.

Then I got a Swan TV-250 for sideband.

2 meters opened up.

I got a Drake R4-B with matching transmitter.

Then in an article [HR magazine in 1970] I read about an 8877 amplifier for 144 MZ. that ran at 2 KW submitted by Eimac Corp.

I was in communication with the author of the article and he sent me blu prints.

With the help of a metal bender from RCA, who still had a plant in Camden, N.J. at the time, I duplicated the amp. :-)

2 KW? That ain't the half of that tube. :-)

I never got the SWR of my antenna system down fat enough due to it's relative in-accessability and burned off several terminations. :-)

I finally gave up none cold winter day and sold the whole Swan/amplafier thing to W3BHG who prompty put it on moon-bounce and increased his states worked total.

He later sold it to someone like Dick, W8MQS, or someone like him. :-)

As far as I know, that amp is still chewing up 8877's. :-) [some 30 years later]

Hi Antwon,

I wanted to thank you for your help last night when reading your reply - it took all I had to read my e-mail and newsgroups. I was dead tired and that was all I could muster. Now that I've had some sleep - here goes.

As to using the radio for Public Service - "I" am a line officer in our Fire Department - so I was "thinking" of "maybe" using it for our fire band in my own vehicle. However - as I know I had stated in my first post - we're supposed to be going to VHF High band soon, so I probably won't bother. I can always use my station issued portable.

As to repairing and aligning, I have a bench full of equipment and knowhow to do so. I just never dealt with a "Moxy" before and wanted some advice on it before I dug into it "deeper" than I already had - especially since I don't have a manual either. As I said, we seem to get only certain models of radios around here - be it the Police, Fire or EMS. Moxy hasn't been one of them. I merely bought it at a hamfest from someone not from this area - and thought "maybe" I could find use for it.

I merely peeked under the cover briefly - having bought it used. Again, that night, I was so tired, I couldn't see straight to go much beyond that point. I do know though, it was transmitting - decent - though I didn't look at the wattmeter - it "may" need tuned a bit.

As I also said, once I determine the problem, I "may" even decide to throw it on E-Bay. IF I don't use it in my vehicle and should I decide not to putter around placing it on 6 meters - I may just do that. As to "Crystal Companies" - it's been a short time since I've bought them - but I am aware of them all. I have a bench full of radios right now to go through to keep me busy for a couple weeks. So - the Moxy "may" go back on the "to do" pile and be there a while - "if" I "do" decide to keep it.

Thanks again, your help was much appreciated. Speaking of work - time to get back to it!

4553. SENCORE TC154 Tube Checker

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-12-04 15:09:19 UTC
From: Bill Ogden <wogden@attglobal.net>
Message-ID: <9lWch.1216$OR.758@newsfe12.lga>
Source record: 9903

I have a TC154 that appears to be in good condition. However, the Emission test of my tubes always reads Good (mid-scale in the green section). Maybe the few tubes I test are all good tubes, but I tend to doubt it. Is there a simple TC154 failure that would cause this? All the other functions seem OK.

Bill

I have a DX-100 D-104 in good working order for sale. Also will
include a spare chassis with some tubes and most parts including mod
xmfr. $350. The S-20R goes for $50.
Prefer pickup in New jersey as too heavy to ship.
Thanks
Rick

4556. BC-684 WWII tank transmitter, value?

Source record: 9906

Picked up a very nice BC-684 with some other stuff recently.
Appears to be NOS, but missing xtals and dynamotor.
Since I don't collect military equipment, I have no idea
what its value is. Nothing on e-bay except for a mounting rack
that sold a while ago.

Steve

Hello,
My grandpa has this nice old boat anchor in his basement. A prototype
from when he built them at Collins. He may go QRT in the next few
years, and wants me to have the rig running and up. We need this
capacitor--he says it drifts badly without it.
Where should I check for it? Anybody familiar with this exciter?
www.flickr.com/photos/jonathancharles/sets and you'll see photos of it
there.
Best 73,
Jonathan 7J1AWL/KC7FYS

Hello friends,

If you need a new website, we are offering the best and most affordable services ever. Our new Website Builder tool will allow you to create custom designed, professional Flash websites in matter of hours...Check out our rates, as little as 12.95$ a month, on our website. No computer knowledge or experience is neccessary. No extra charge for domain registration, web hosting or computer support. Check out our packages starting at 12.95/month today!

http://www.MyBestDealEver.com (My Best Deal Ever.com)

thank you,

info@MyBestDealEver.com

I also have mastered CW very well and have used it many times in weak signal work on 2 meters. I have an Advanced license and never felt the need yo go beyond if for my purposes.

As to whether I still feel it's a hugh priority, no I don't.

With today's modes of communication it does seem out-moded.

My typing is better than ever and many new modes use a keyboard. :-)

I assume this is a capacitor with a particular TC that is used to
compensate for the drift of some other parts with temperature?

If so, you need to know both the value and the TC, and then you can
order what you want out of the AVX catalogue.

The note drawn on the schematic in Jonathan pictures says "0 temp coefficient, 710 mmfd". The parts list in the manual doesn't list the parts internal to the 70E-8A PTO- it just says to send it to Collins for service.

I've popped the covers off a spare 70E-8A, and the cap says "Merlec Corp. 913 009 6 00" on one side, and "710 mmf +/- (?) 1%" on the other.

So, is 0 TC and 710 pf enough to order a replacement? It's a stud-mounted ceramic disc cap.

I'd like to finally solve the amazing drift problem with my 310 B-3 as well. I asked about it months ago, and a couple of people took the time to suggest ideas (thank you!), but still no luck...

Thanks,
Dale

KJ7SL

P.S. If anybody has the parts list for inside the PTO, it would be helpful.

Hi Jonathan,
I've already posted a message asking for more info about that capacitor,
but I just wanted to thank you for posting the pictures of your grandfather's
prototype. It's interesting- the meter is on the right side, like the bandswitching
310B-3. But on the 310B-1, the meter is on the left, even though the meter
switch (grid-plate) remains on the right. I've always thought that was odd.
Also, the chrome trim bars on your prototype are long, and not centered.
Were those taken from another model and placed on the 310 prototype the
way they were for some logical reason?

Of course, the plastic switch labels were probably added much later.
But the knobs are unique, and I'm guessing they are original.

If you haven't already, you really should "interview" your grandfather
about everything he remembers about his work at Collins. There's a
Collins history group online, and I'm sure they love getting the info.

Well, enough babbling from me. I just wanted to say thanks. And
good luck to both of us in eliminating that pesky drift :)

Oh, use any modern NPO or COG dielectric ceramic capacitor. That's close
enough to zero. Probably closer than the original.

Try Digi-Key part P4859-ND. That's a 100V, 680 pF NP0 ceramic.
If 680 pF isn't close enough, add a 33 pF in parallel. Fifty cents each,
discount if you buy ten.

Avoid the high density Y5P Z4V, etc. dielectric types like the plague
because they will have a very high temperature coefficient.

Maybe I am missing something here - I've looked into sites - free or cheaper and not found any which get you a "domain" name "AND" include web site building tools for those who are clueless about web page building. "MY" web site is ok - but needs much more work and "I" am not the one doing it - I must depend on a friend, who is very busy. I would love to have one where "I" can do the stuff myself - since I am online often for other business purposes as well. "I" could and would take the time to add things to my site - IF I could. And right now - product is missing - terribly. I think my site only costs $60 a year - can't recall without looking at my invoice - which I don't have handy at the moment. But - it doesn't have the "tools"!

And Yahoo - seems to have "sucker" deals - luring you in with something cheap - then hit you for all kinds of add ons.

For what it is worth, I do not mind paying a "Decent" fee for a site "I" COULD do myself.

4573. FS Atas 210X HF Transceiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-12-05 19:08:07 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <isjdh.59173$1w6.13759@newsfe16.lga>
Source record: 9923

FS: An Atlas 210X. This transceiver came from an estate. I did not get a manual or mic or power cord. I made a power cord to test the radio. In receive I hear some low level static coming
out of the receiver, but I was not able to hear any signals. I did not try it in transmit. The transceiver looks almost new, but I think it has set up for a long time, so it may need some of the capacitors changed.
I will take $95 plus shipping form 79602. I can send digital pictures.
Thanks,
Charlie Hugg, K5MBX

Some of us move on to the latest technologies, but also have a feel for our
roots.

It never needs to be one or the other.

With the Internet, Cell Phones, etc; many could say "a lot" of the modes are
"outdated" - not just "CW". RTTY is a prime example, E-Mail has surpassed

that by far - yet there are die-hards who love it and use it. Same with the other "digital" modes. Packet is even still used! Code doesn't have to go by way of the dinosaur - but still - it is only as useful as many want it to be. Hell, some may say 2 meters is ancient!

The catch phrase is - to each his/her own. Whatever mode you enjoy - DO IT! Do check out the others too - as you may find you like more than one - but don't beat someone else up - simply because they don't use the one "you" advocate.

As to Mr SC, he's never proven himself a ham - one way or another. How do WE even know HE passed a code exam? We don't. Furthermore - the argument is a moot point. IF the FCC drops it, there's not a damned thing we're going to do. Also, CODE - regardless what some would like to think - does NOT keep the riff raff off the bands - it was there LONG before NO CODES came to be. MANY of them were Generals, Advanced and Extras. I KNOW - I was an Official Observer and sent MANY notices. So, I don't even want to hear that CODE is the saving grace of Ham, it is not. It is the PSYCHE of EACH OF US - to decide to keep it clean OR not. END OF STORY.

There is a schematic of the 70E as part of the schematic
for the 32V-3 which I got off the Collins Org site at:
http://www.collinsradio.org/html/manuals.html
While the component values are shown they are not listed
in the parts list, probably because the PTO was serviced by
replacing it as a unit. However, the circuit layout may be
useful. The 710uuf cap appears to be the main resonating
capacitor in the oscillator tank. There is also a variable
capacitor and a cap marked with an asterisk with a note that
it is chosen at the factory. There is no indication of what
it is chosen for or its approximate value. It would be
surprizing if the 710uuf cap is a temperature compensating
cap because of it is the predominant capacitance in the
circuit but you never know. It may be that someone at this
site knows more about the construction of the 70 series
PTOs.
I had always heard that PTOs would drift if the seal was
broken. Evidently they were filled with dry air. Some at
least have dessicators in them. Evidently low humidity is
important to their operation.
I would explore the Collinsradio Org site, maybe you can
find something definite there.

How would that cause drift? Couldn't it just be to prevent
corrosion, especially on the pickups of a roller inductor
inside?

I picked up the NPO caps yesterday, and I'm looking
forward to seeing if the cure the drift.

All,

I got bit by the genny bug again (happens every year at the start of Thanksgiving:)), and have been doing research on this year's designs.

1) I have heard that using discarded pill bottles is a bad practice due to the plastic spoiling the Q and having a low melting point.

I have access to some kaolinite clay (porcelain) and a kiln. If I mold and fire my own coil forms out of porcelain, what would be its effect be on tank Q? And do I need to glaze it?

2) Does anyone know how to bias a triode or pentode for high speed switching?

Thanks in advance,

The Eternal Squire

Genny?

Depends on the frequency, but pill bottles are not the best possible
material. Try styrene.

Porcelain should be self-glazing, because it vitrifies. It should have
a poorer dielectric constant than air, though.

The ITT Radio Engineer's Handbook has a table in chapter 6 that lists
constants for various materials.

>2) Does anyone know how to bias a triode or pentode for high speed

How high speed do you want and why don't you want to use a gas tube?
With a vacuum tube, you pretty much have to run class C in order to get
complete cutoff. But what you want is a thing with a discontinuity in
the curve if your goal is to get a nice sharp square wave. That means
a thyratron, krytron or something. Then again, maybe you don't need a
nice sharp square wave.

I don't know, I never heard an explanation. It might not
even be true. I suppose its possible that moisture could
have some effect on something inside.
Mainly, I thought someone at the Collins site might have
specifications on the components used in the PTO.

Hi Gang:

This is a nice old G.E. loudspeaker. case is heavy metal and measures 6-1/2" by 6-1/2". My guess is that it came from a communications console in some fire or police department from the 1950s.

I'd like to get $15.00 for it plus postage. Any takers?

If interested please reply by e-mail.

73,

Michael,

Of what? If you want to put it on 160M you might manage it, but you are going to have very poor efficiency.

Figure you want a switching rate less than a tenth of a cycle, if all you want to do is just reproduce the RF signal. If you want to use the PWM device to do the modulation as well, you will need to go much faster.

You may want to look at some of the Brown-Boveri AM broadcast transmitters, which use switching output stages, driven by PWM oscillators that handle both the modulation and the carrier. The output integrator is a nightmare, even at 200M.

They are using big switching FETs. You don't really need the sharpest square wave coming out of the output stage, though, because it's just producing stuff that the harmonic filter is going to eat up anyway.

There are some very high speed gas tubes out there, like krytrons, but most of them aren't very high power. The real issue, though, is what kind of frequency you really want and if you want to do the modulation or just the carrier with the switcher.

Just the carrier. Was wanting to see if I could stretch a tube the
normally puts out 1 watt class A into 5 watts or more in class E. So
tell me, why the difficulty using a tube rather than a Mosfet? Don't
tubes and Fets behave similarly from an electrical point of view?

The Eternal Squire

Are you sure you don't mean "Class D" ?
ISTR that Class E is a PWM switched signal fed into a low
pass filter.

Class D uses a technique that aligns the current and voltage
zero crossings with the switching, or something like that.

-Chuck

Similarly but not identically, and the top of the curve is what's important in a switching application where you're trying to saturate the device. You want something with as abrupt a transition in the curve as you can get, and something with a huge amount of gain. But you also want something that switches really, really fast. Tubes in general tend to be slower, lower gain, and more linear.

Honestly, if you just want the carrier, though, it doesn't buy you anything over normal Class C operation.

This is not a warm and fuzzy "feel good" letter like much of the baloney you read in the ham radio press. If you are one of those individuals who don't mind a little sand kicked in your face as long as you have your grandchildren on your lap yakking away on your Kensu Pro Mark III, we urge you to read no further. Ugly truth follows. But, as they say, the "devil that you know is better than the one you don't."

The time has come (and it may indeed have passed) for trying to fix what ails ham radio. Ham radio has gone down "for the count." It has been sucker-punched with corrupt referees allowing much "dirty fighting" and knees to the groin. Regardless of the grand schemes of the ham radio aristocracy, the numbers are down. People aren't getting licenses anymore for many reasons but largely, because it has become a meaningless exercise. It is no longer an achievement of anything. So, they drift away. Years ago the ham population was a fraction of the size it is today and no one worried about how many hams there were. The only reason they keep dragging out this silly numbers issue is because of how many magazine subscriptions and transceiver sales it represents. THAT IS IT. Follow the money trail and you will always be led to the culprit. It has nothing whatsoever to do with any noble concern over sharing the ham radio experience with as many people as possible. It's pure greed.

It is time we CW operators grow some hair on our chests. We have sat by and watched the FCC, Newington, manufacturers (you know which ones) and "No Code International" playing freely with this once great avocation. We CW operators have bootlicked and tried to remain passive and gentlemanly while they vandalized and stole from us. We have tried so hard to abide by Paul Segal's "Amateurs" Creed" that was pounded into us that we were fearful that our speaking up would break one of his sacred commandments.

It is insulting that lobbying by the "no code" idiots and those who stand to benefit from amateur radio entrepreneurship have succeeded in weakening the licensing requirements. They continue to chisel away at the license and enable people with little investment in learning and commitment to share the same spectrum with true ham operators.

We propose a federation of real amateur radio operators who are fed up with the diminished requirements cheapening the license achievement they were once proud to have. We propose a federation of people who are disgusted with the beating that the Morse code and the integrity of the licensing examination have taken. We propose to fight back. The mountain is steep and our adversaries have been able to get better footing. We probably cannot win". It may simply be too late. But maybe we can soften how bad the impact will be when ham radio crashes to the ground. Also we can at least show

those who are solely responsible for the end of the amateur radio service (which some have predicted could be within 10 years) that they personally destroyed a great communications service.

Earnest and dedicated ham operators must express outrage. Those puff-headed sycophants who we hear spewing the propaganda about "need for change" need to be challenged. Amateur radio is NOT about enabling kids to mumble nonsense on a 2-meter handi-talkie or how many secretaries in the front office in Newington got their faux- Extra class license. By reducing requirements and making a ham license easier to obtain DOES NOT MAKE FOR ANY SORT OF AN ACCOMPLISHMENT. Period. Amateur radio at one time was steeped in solid traditions and pride of accomplishing what it took to wear the title. Amateur radio was The Genuine Article. It was real. It had solid requirements and those who aspired to fulfill those requirements had reason to be proud of their achievement. NPRMs have repeatedly received overwhelming rejection but yet they are made into law. Why aren't they listening to the respondents? Why are the only ones they listen to the minority? The answer is this: because there is no respect for the playground weaklings.

FED UP CALLING FREQUENCIES Bottom of new phone band
(e.g 3600 KHZ , 7100 KHZ
etc)

CW operators have just suffered a slap to the face by the diminished CW sub-bands in the so-called Omnibus bill. We propose all CW operators register disapproval by continuing to use the old sub-bands. PLEASE NOTE: Before the angry emails start, understand that we are NOT advocating intentional interference to phone operations! We CAN co-exist. God knows we US CW operators have been putting up with Canadian phone QRM in our US CW bands for years. Shouldn't What's good for the goose is good for the gander prevail here? Why are the phone operators treated as such hothouse orchids? . For starters, on each amateur radio band, we propose the frequency that separates the CW and the phone sub-bands become a CW calling frequency for FEDUP hams to share thoughts and camaraderie with like individuals (For instance, 3600 KHz). Since CW operations are permitted from 3500 to 4000 khz, our operation on the bottom end of the new phone band is not violating anything. Phone operators, however, will be restricted from using this frequency since splatter would fall outside of their sub-band.

We propose establishment of an organization to be known as FEDERATION FOR UNCOMPROMISED PROFICIENCY (FED UP). To this end we are soliciting people willing to help write letters (FCC commissioners, congressmen, USA Today, agencies, manufacturers, magazine advertisers that use anti-CW publications...anyone influential to whom we can express our dissatisfaction as to what has been going on in this communications service). We are also soliciting hams with expertise in legal matters, media, business and marketing who would like to help us. Our goal is establishment of a professional lobbying effort to reverse the damage that has been done to the amateur radio service, the license, the quality of operators and the future

of the service. The primary focus is be re-establishment of proficiency to the amateur radio license and awarding levels of proficiency with privileges. Yes, this has been tried as recently as the last couple of years. Like we said earlier we are going uphill and it is not &#65533;politically correct&#65533; in today&#65533;s amateur radio environment. But WE NEED TO BECOME MORE VOCAL. We need to stop being fainting goats. We need to get some FIRE IN OUR BELLIES and fight!

If you are interested in helping us put together an organization to challenge the horrific FCC rules and regulations and the idiotic policies that have been imposed on we ham radio operators, we invite you to contact us. When we see what the interest level is we can better assess a potential group&#65533;s structure. Obviously our first order of business will be establishment of a core mission and an executive staff to drive this effort. Please email us at fedup@intergate.com. Please be patient for our reply. We will respond to all serious inquiries personally. No doubt we will get a lot of moronic and angry emails, which will simply be deleted. Even so, it no doubt will take time to wade through the legitimate ones. And confidentiality will be maintained because we know none of you wish to put up with an e-mail inbox full of messages from goofballs.

We have been ignored because we&#65533;ve consistently lied down and complied. The bullies always pick on the kid who is most passive. We&#65533;ve been in such as rush to show how agreeable we are with all the &#65533;crap propaganda&#65533; coming out of the ham magazines, that we didn&#65533;t even notice how the good things were slipping away. Our attention was diverted from their erosion of technical proficiency and abilities as a well-rounded communications operator (including knowing the Morse code) while they distracted us with the razzle-dazzle of vanity callsign giveaways and a host of scary-but-bogus threats to the welfare of ham radio.

If you&#65533;ve got any fight left in you we&#65533;d like to hear from you.

73, ZUT and QTX

<bunch of stuff snipped>

"I" am NOT "against" code, I had to take it to acquire my licenses and I am and have been for some time - an Extra. HOWEVER - I do NOT see CODE (CW) as being the saving grace of Ham Radio - be it to save lives or keep the crap off the bands. As I pointed out in a previous post - I was an OO (Official Observer) some years ago - LONG before NO CODE was even thought of. I wrote out more notices to those who "should" have known better - but showed no care. I am talking GENERALs (13 WPM), ADVANCED (13 WPM) AND EXTRAS (20 WPM).

There is a deeper issue than CODE - diminishing our ham ranks. INSTEAD of rallying JUST for "code", get off your <CW> high horse and start rallying for BETTER "THEORY" exams - since the new books don't teach CRAP - and start getting your SCHOOLS involved in putting TECHNOLOGY - ALL OF IT - back into the curriculums.
MODES using ELECTRONICS - which will need maintained - will still be here LONG after CW has died.

AGAIN - I'll say - here at least - all they give a shit about is FOOT BALL. These bozos sold off all "shop" equipment - be it for wood, metal, electronics, etc - and raised taxes ONLY to build stadiums for the "Football" teams - to rival those of the pro stadiums. The "supplies" kids used to get at start of school - NOW have to be bought by mom and dad - or else! COME ON! IF THEY ARE LUCKY - only ONE person out of MAYBE 10 graduating classes will get a scholarship to a university for Football - much less go to the Pro's. TO HELL WITH SPORTS - THIS COUNTRY DOES NOT EXCEL ON SPORTS ALONE. WE NEED to make BUSH OR WHOEVER - get TECHNOLOGY back into the class rooms or it won't be "JUST" no child left behind, it will be an entire COUNTRY - LEFT BEHIND.

You guys have your priorities - ASS BACKWARDS.....

4605. Need Heathkit 102 knob...

Newsgroup: rec.radio.amateur.boatanchors

Thanks for posting this Jim. Maybe now people will see that dumbing down ham radio was a bad idea.

In a way I can't believe what I'm reading. CW is just a mode of communication like any other. At times it might come in handy. :-)

I prefer SSB for sure, but that's not really the point.

I'm hearing grown men argue like kids.

I hope this is not where hame radio has sunk since 1976. :-(

It pains my ears to hear it.

If a ham is proficient and dedicated, does CW really mean that much?

This is being said by a guy who used to talk to my foreman, W3FUF, (1960) who was a member of the Frankford Radio Club.

Most of their comtest work was done on CW.

I used to talk to him across the shop using the air hose. It sounded like spark gap but it was very effective! :-)

I go with the times but will never forget CW. :-)

You mean, the device needs to be nonlinear?

> But you also want something that
> switches really, really fast.

Like the 12AF4 or one of the other tubes used in VHF tuners?

> Honestly, if you just want the carrier, though, it doesn't buy you anything
> over normal Class C operation.

Then why are people putting so much store by class E operation for CW
amplification?

I guess back to the drawing board. What I was thinking was to use a
genny as VFO to
inject a carrier into a buffer amp driving a CW amplifier.

>amplification?

Damned if I know. Class C already gets you extremely good efficiency,
and it's not like with the legal limit being what it is that you're going
to save much on your power bill. If you're running 250KW, of course, every
little bit counts, and the ability to do AM modulation at the same time
makes it very valuable for high power broadcast applications.

I opened the meter of an Hallicrafters SX-117 to mechanically adjust the zero. Once open, the meter appeared to be of the moving iron type, that is with no moving coil. But I was surprised to see that that meter has no spiral torsion springs either; I can only see a metal (?) dish mounted on the axis, part of which lies inside a rather flat coil.

With no spring, I cannot understand what forces the needle to stay at zero scale in absence of current. Therefore I cannot figure out what I should do to adjust the zero.

The HT-44 as well as the EICO 723 use the same type of meter. Dumping is poor, and the needle keeps banging for a while when you apply a DC current.

'Genny' means "regenerative receiver circuit", typically a direct
conversion regenerative mixer/oscillator followed by an audio amplifer.
Sometimes preceded by an RF amplifier to help prevent the carrier from
radiating back into the antenna.

There's plenty of them out there but only recently did I see a few that used tubes wired in space charge mode for 12V operation. One of the designs slapped on a crystal oscillator as QRP transmitter to create a full transciever, but why not simply use the regenerative oscillator as a VFO into the transmitter?

I don't know for certain about the meter in the SX-117
but a lot of instruments use what are called taut-band
suspension. The meter coil or vane and pointer are suspended
on a flat ribbon running along the axis of rotation and
fastened at the ends. The band acts as both support for the
moving mechanism and as the restoring spring. It is
essentially a torsion spring.
The advantage of this system is that it eliminates the
bearings along with the friction and hysterisis they cause.
Taut-band meters have very good repeatability and can be
very accurately calibrated. Hewlett-Packard began to use
taut-band meters in their instruments along around the early
1960's and they became common around that time. Taut-band
meters do have zero-adjustments but they may be internal.
The damping of any meter is a matter of the back EMF of
the meter. No meter running open circuit will be well
damped. It may be that the testing circuit does not have low
enough resistance to damp the meter. If you rotate the meter

open circuit the pointer wil move around a lot. If you short
the terminals it will barely move at all.

If you can be a little bit flexible, and you don't need continuous
duty operation, consider opening up a microwave oven.

Hi, Tony

I have a "Shurite" brand iron vane panel meter, similar to what you describe. The meter's zero adjust screw is connected to a semicircular metal disk mounted at a right angle to the axis of the pointer shaft. There is no contact between the semicircular disk and the pointer assembly. I suppose zeroing is based on adding or counteracting residual magnetism in the fixed iron vane. I don't see any torsion springs in the Shurite meter.

An iron vane meter was used in the Heath DX-35, and I remember the underdamped response. You could practically monitor your sending by the sound of the meter pin hitting the end stops.

Where's the PWM coming from? You could have a stock sine wave oscillator
driving a PWM modulator built as a relaxation oscillator, but somewhere you
need the modulation.

(Of course, doing this in the analogue domain kills most of the advantage,
but it still might e worth trying).

>There's plenty of them out there but only recently did I see a few that

Because the regenerative oscillator isn't exactly stable, to begin with.
Also, if you're running a switching output stage, you need a PWM signal
whose duty cycle in some way corresponds with the waveform you want to
produce, and that takes a bit more than just a simple free-running oscillator
(which is what a regenerative amplifier is if you crank that regen control
up too much).

Hi Dick,

in taut band meters the taut band replaces the torsion springs. But the
Hallicrafters meter has a rigid axis (not taut band), and has neither torsion
springs nor a moving coil, so it must work on a different principle.

Thank for the advice and 73

Hi Ed,

yes, the meter is just as you wrote. I did not know the name "iron vane meter", good to know.

Carefully examining the meter, I found it very similar to what you wrote. On the axis I can see two parallel round disks (orthogonal to the axis) one at the axis center and one at its extreme:

- the first disk is fixed to the meter axis, and part of it lies inside the coil. When current flows through the coil, the disk (and the axis) rotates. I presume that the magnetic properties of that disk are not homogeneous (maybe half disk is magnetic and the other half is non magnetic)
- the second disk is instead not fixed to the axis. Its position can be changed by a means of a screw placed at the axis end (just like the zeroing screw of normal meters). I presume that also this disk is non-homogeneous. Rotating the disk changes the meter zero. I tried and it works!

Thanks and 73

Tony I0JX

4636. 30 helpful hints to help new and No-code hams. Monthly post.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-12-10 00:52:53 UTC
From: Slow Code <my.mail@no.spam>
Message-ID: <FTIeh.8313$sf5.5152@newsread4.news.pas.earthlink.net>
Source record: 9886

The 30 Steps below will help all No-Code Hams, it will also help you to find others just like yourself. These 30 steps should also be added to the present writtens.

Step One: Use as many "Q" signals as possible. Yes, I know they were invented solely for CW and are totally inappropriate for two meter FM, but they are fun and entertaining. They keep people guessing as to what you really meant. I.E. "I'm going to QSY to the phone." Can you really change frequencies to the phone? QSL used to mean, "I am acknowledging receipt", but now it appears to mean, "yes" or "OK". I guess I missed it when the ARRL changed the meaning. It is also best to use "OK" and "QSL" together. Redundancy is the better part of Lid-dom.

Step Two: Never laugh when you can say "HI HI". No one will ever know you aren't a long time CW rag-chewer if you don't tell them. They'll think you've been on since the days of Marconi.

Step Three: Utilize an alternative vocabulary. Use words like "destinated" and "negatory". It's OK to make up your own words here. I.E. "Yeah Tom, I "pheelbart zaphonix" occasionally myself."

Step Four: Always say "XX4XXX" (Insert your own call) "for I.D." As mentioned in Step One, anything that creates redundancy is always encouraged. That's why we have the Department of Redundancy Department. (Please note that you can follow your call with "for identification purposes" instead of "for I.D." While taking longer to say, it is worth more "LID points".

Step Five: The better the copy on two meter FM, the more you should use phonetics. Names should be especially used if they are short or common ones. I.E. "My name is Al... Alpha Lima" or "Jack.. Juliet Alpha Charlie Kilo." If at all possible use the less common HF phonetics "A4SM... America, Number Four, Sugar Mexico." And for maximum "LID points", make up unintelligible phonetics. "My name is Bob... Billibong Oregano Bumperpool."

Step Six: Always give the calls of yourself and everyone who is (or has been) in the group, whether they are still there or not. While this has been unnecessary for years, it is still a great memory test. You may also use "and the group" if you are an "old timer" or just have a bad memory. Extra points for saying everyone's call and then clearing in a silly way "K2PKK, Chow, Chow."

Step Seven: Whenever possible, use the wrong terminology. It keeps people guessing. Use "modulation" when you mean "deviation", and vice-versa.

Step Eight: If someone asks for a break, always finish your turn, taking as long as possible before turning it over. Whenever possible, pass it around a few times first. This will discourage the breaker, and if it is an emergency, encourage him to switch to another repeater and not bother you.

Step Nine: Always ask involved questions of the person who is trying to sign out. Never let him get by with just a "yes" or "no" answer. Make it a question that will take him a long time to answer.

Step Ten: The less you know on a subject, the more you should speculate about it in the roundtable. Also the amount of time you spend on the subject should be inversely proportionate to your knowledge of the subject even though you have no damn clue.

Step Eleven: Always make sure you try to communicate with only a handheld and a rubber duck antenna. Also, make sure you work through a repeater that you can hear very well, but it cannot hear you. This will put out a kind of "LID mating call": "Well, Joe, I can hear the repeater just fine here. I wonder why it can't hear me?" You will score maximum LID points if you are mobile, and with the radio lying in the passenger seat.

Step Twelve: If you hear two amateurs start a conversation, wait until they are twenty seconds into their contact, and then break in to make a call, or better yet to use the auto-patch. Make sure you keep the repeater tied up for at least three minutes. This way, once the two have re-established contact, they won't even remember what they were talking about.

Step Thirteen: You hear someone on the repeater giving directions to a visiting amateur. Even if the directions are good, make sure you break in with your own "alternate route but better way to get there" version. This is most effective with several other "would-be LIDs", each giving a different route. By the time the visiting amateur unscrambles all the street names whizzing by in his mind, he should have moved out of the range of the repeater. This keeps you from having to stick around to help the guy get back out of town, later.

Step Fourteen: If an annoying station is bothering you, make sure your other "LID" buddies have a "coded" frequency list. Even though "CODES" are strictly forbidden on Amateur Radio, it's really neat to practice "James Bond" tactics.

Step Fifteen: Always use the National Calling Frequency for general conversations. The more uninteresting, the longer you should use it. Extra points are awarded if you have recently move from an adjacent frequency for no reason. Make sure when DX is "rolling" in on 52.525 that you hang out there and talk to your friends five miles down the road about the good old CB days!

Step Sixteen: Make sure that if you have a personal problem with someone, you should voice your opinion in a public forum, especially a net. Make sure you give their name, call, and any other identifying remarks. For maximum points, make sure the person in question is not on the repeater,

or not available.

Step Seventeen: Make sure you say the first few words of each transmission twice, especially if it is the same thing each time. Like "roger, roger" or "fine business, fine business". I cannot stress enough about encouraging redundancy.

Step Eighteen: If you hear a conversation on a local repeater, break in and ask how each station is receiving you. Of course they will only see the signal of the repeater you are using, but it's that magic moment when you can find a fellow "LID", and get the report. Extra points are awarded if you are using a base station, and the repeater is less than twenty-five air miles from you.

Step Nineteen: Use the repeater for an hour or two at a time, preventing others from using it. Better yet, do it on a daily basis. Your quest is to make people so sick of hearing your voice every time they turn on their radio, they'll move to another frequency. This way you'll lighten the load on the repeater, leaving even more time for you to talk on it.

Step Twenty: See just how much flutter you can generate by operating at handheld power levels too far away from the repeater. Engage people in conversations when you know they wont be able to copy half of what your saying. Even when they say your uncopyable, continue to string them along by making further transmissions. See just how frustrated you can make the other amateur before he finally signs off in disgust.

Step Twenty One: Use lots of radio jargon. After all, it makes you feel important using words ordinary people don't say. Who cares if it makes you sound like you just fell off Channel 19 on the citizen's Band? Use phrases such as "Roger on that", "10-4", "I'm on the side", "Your making the trip" and "Negatory on that".

Step Twenty Two: Use excessive microphone gain. See just how loud you can make your audio. Make sure the audio gain is so high that other amateurs can hear any bugs crawling on your floor. If mobile, make sure the wind noise is loud enough that others have to strain to pick your words out from all the racket.

Step Twenty Three: Start every transmission with the word "Roger" or "QSL". Sure, you don't need to acknowledge that you received the other transmission in full. After all, you would simply ask for a repeat if you missed something. But consider it your gift to the other amateur to give him solace every few seconds that his transmissions are being received.

Step Twenty Four: When looking for a contact on a repeater, always say your "listening" or "monitoring" multiple times. I've always found that at least a half dozen times or so is good. Repeating your multiple "listening" ID's every 10 to 15 seconds is even better. Those people who didn't want to talk to you will eventually call you, hoping you'll go away after you have finally made a contact.

Step Twenty Five: Always use a repeater, even if you can work the other station easily on simplex ... especially if you can make the contact on simplex. The coverage of the repeater you use should be inversely proportional to your distance from the other station.

Step Twenty Six: When on repeaters using courtesy tones, you should always say "over". Courtesy tones are designed to let everyone know when you have unkeyed but don't let that stop you. Say "over", "back to you" or "go ahead". It serves no useful purpose but don't worry, it's still fun!

Step Twenty Seven: Use the repeater's autopatch for frivolous routine calls... especially during morning or evening commute times. While pulling into the neighborhood, call home to let them know you'll be there in two minutes.... or, call your spouse to complain about the bad day you had at work. After all, the club has "measured rate" service on their phone line so they get charged for each autopatch call. Your endeavor is to make so many patches in a year that you cost the club at least $20 in phone bills. That way you'll feel you got your money's worth for your dues!

Step Twenty Eight: Never say "My name is ....." It makes you sound human. If at all possible, use one of the following phrases: a) "The personal here is ..." b) "The handle here is..."

Step Twenty Nine: Use "73" and "88" incorrectly. Both are already considered plural, but add a "s" to the end anyway. Say "73's" or "88's". Who cares if it means "best regards" and "love and kisses." Better yet, say "seventy thirds"! (By the way, seventy thirds equals about 23.3).

Step Thirty: If the repeater is off the air for service, complain about the fact that it was off the air as soon as it's turned back on. Act as though your entire day has been ruined because the repeater wasn't available when you wanted to use it. Even thought you have never paid a penny to help out with the upkeep of it.

What do I do after I put in my cup of coffee?

Sorry.... bad joke.

It's for AM on a pair of 813's so think I need to think bigger but...

I have 2 Viking Valiants with the original manuals. They have not been fired up in quite awhile and not sure if they work...One is in very good condition with a new Peter Dahl power supply and the other is in good condition.....I will take $450 for the both of them, but this is a pick up only. I'm located in Lakeville, Ma. 35 miles South of Boston. I have plenty of digital pictures if needed. With the 2 complete units I'm sure one can get going with plenty of parts from the other one. If you have any questions email me or call (508) 821-2993.......WZ1U Steve / Lakeville, Ma.

Well, figure input power on a good-sized Amana microwave is around 1000W,
so you're in the ballpark at least. If you can find two microwaves of the
same model you can parallel the transformers. Be sure to cool the things,
though, if you're going to be running any reasonable duty cycle.

Looking for a Shure microphone stand. Preferably a teardrop
shape base with short tube. Its for the Shure 708 'stratoliner'
mic I'm planning to use with my HT-44.

Stand doesn't need to be perfect. The mic and radios aren't...

Note also that you'll need to remove the copper shunt, if one is
present, from the transformer laminations, _and_ that one side of the
HV winding may be grounded to the XFMR frame.

This is total crap! There is no "radio" involved. All you have to do is
be dumb enough to pay a $32.00 a year "subscription fee" to talk to
people on the internet, and pretend it's "Ham Radio." There IS a sucker
born every minute!

such power you credi t me with but real SC i must decline the honor the
wrecking of Ham radio as you choose to define it is your own doing
along with Heil Robesonn Jim old posters like Yo Doc and MD you killed the
hamradio you sought to save, basicaly by trying to ram it down the throats
of the rest of us in the 1990 the NoCoders would like have settled for
something wht Canada has in place now, presreving a lot of what you wanted
gay bashers are not welcome anywhere that is why they use fake names ike

They can do all that? Wow. You better get to eleven meters then and work
on your radio skills, then come back here and teach the rest of us.

Never gave any thought to this but the one problem I see is that I need
a center tapped transformer to use with 866's and the microwave ones do
not seem to be.

Why should the shunt be removed? I have never seen one on there, but why should I remove it if I see it?

The HV winding on these is always grounded to the frame, but it's usually very clear where the ground point is and it's not difficult to lift. I would be reluctant to do this, though, because I am not sure how well the interior is insulated.

It is not, no. You can use two out of phase, but that kills your volume
requirements.

Could anyone use some Thordarson power supply chokes?
I have two available at:
http://tinyurl.com/yncb72
http://tinyurl.com/yb8vqb

Or some Cutler-Hammer 200 Amp relays?

I hope it is OK to mention an occasional auction item or two on here.

I have two of the relays available for auction at:
http://tinyurl.com/ydbj2a
http://tinyurl.com/ybqhyx

Also a UTC military radio transformer:
http://tinyurl.com/y9jzre

and some AGSTAT time delay relays:
http://tinyurl.com/ymh9v8
http://tinyurl.com/ycbord
http://tinyurl.com/y9n76a

and some POTTER & BRUMFIELD time delay relays:
http://tinyurl.com/yen8fr
http://tinyurl.com/yktgly
http://tinyurl.com/ykeu6h

I have several other RF coils and chokes etc. on there
and I plan to post more soon.

Thanks for looking...

With the shunt in place the transformer is more of a constant current
rather than a constant voltage device.
The voltage regulation will be poor. When you remove the shunt then the
primary winding doesn't
have enough turns for the 115 volts.
Good luck with the project

Bill K7NOM

far be it from me to comment.

11 meters, if properly managed could be such a medium. However, given all the bucket mouths, bad attitudes and folks that just don't care, getting help on there is risky business these days (I know, I used to run a CERT station here in phoenix during the monsoon season, it always turned into a clusterfuck with all the yahoo's wanting to cause problems when I was trying to help out folks needing real help). with all that going on, it was a real clusterfuck. thats why I pretty much gave up on the band and moved to amateur radio. at least there, we have readiness drills, man public service events and have a proven track record (and that record is well documented).
I see no indication of such a record even existing for 11 meters and I seriously doubt anyone ever will. now, unless we get a whole new crowd down there that can behave and act in a reasonably competant and professional manner, I don't see it being anything other than the "Childrens Band".

This is exactly what makes 11 meters a refreshing change at time, less
rules, regulations and you can make the band fit you, rather than having
to re-work humans into fitting a band ... it really just needs left alone.

Much, much more useful for some endeavors!

I do wish this newsgroup would return to its real topic -- boatanchor (=old valve and heavy) radios and not perpetuate this eternal argument, which surely needs its own newsgroup since people are so wound up about it. I'm sure both sides have their points but can we avoid degenerating to the level of certain other amateur radio newsgroups?

Website: www.freeweb.com/fed_up

Thank you to those who have responded to the previous posting. We are working hard to catch up on correspondence. Apparently there are a lot more hams who are disgusted with the deterioration of the hobby than we thought. As for the emails we have received with threatening or obscene (and many, just plain stupid) comments, thank you; we plan to post the most ridiculous ones on our website when it is fully assembled.
For those of you who missed the first posting, the original CALL TO ACTION - CW ADVOCACY GROUP FORMING newsgroup posting follows. For you supercillious phonies who bellyache that this if "off topic", may we remind you that you sat by and said nothing during all of the anti-CW postings that have appeared here. Apparently those were "on topic." It matters not whether we are "granpaws" (sic) or "dinosaurs" or whatever other epithets you feel you wish to sling; one thing is sure, that you are a prime example of the death of free speech which should be a cornerstone of any communication service in a free society. Besides that, what makes you think that a "granpaw" has lost his right to expressing his opinion? Perhaps in YOUR world you would deny your own "granpaw" his right to an opinion. Perhaps in your world you need to remember that you are not getting any younger either and, sooner or later, you'll be there too. By the way, this writer is hardly a "granpaw," so your assertion doesn't stick.

CALL TO ACTION - CW ADVOCACY GROUP FORMING

This is not a warm and fuzzy "feel good" letter like much of the baloney you read in the ham radio press. If you are one of those individuals who don't mind a little sand kicked in your face as long as you have your grandchildren on your lap yakking away on your Kensu Pro Mark III, we urge you to read no further. Ugly truth follows. But, as they say, the "devil that you know is better than the one you don't."

The time has come (and it may indeed have passed) for trying to fix what ails ham radio. Ham radio has gone down "for the count." It has been sucker-punched with corrupt referees allowing much "dirty fighting" and knees to the groin. Regardless of the grand schemes of the ham radio aristocracy, the numbers are down. People aren't getting licenses anymore for many reasons but largely, because it has become a meaningless exercise. It is no longer an achievement of anything. So, they drift away. Years ago the ham population was a fraction of the size it is today and no one worried about how many hams there were. The only reason they keep dragging out this

silly numbers issue is because of how many magazine subscriptions and transceiver sales it represents. THAT IS IT. Follow the money trail and you will always be led to the culprit. It has nothing whatsoever to do with any noble concern over sharing the ham radio experience with as many people as possible. It's pure greed.

It is time we CW operators grow some hair on our chests. We have sat by and watched the FCC, Newington, manufacturers (you know which ones) and "No Code International" playing freely with this once great avocation. We CW operators have bootlicked and tried to remain passive and gentlemanly while they vandalized and stole from us. We have tried so hard to abide by Paul Segal's "Amateurs" Creed" that was pounded into us that we were fearful that our speaking up would break one of his sacred commandments.

It is insulting that lobbying by the "no code" idiots and those who stand to benefit from amateur radio entrepreneurship have succeeded in weakening the licensing requirements. They continue to chisel away at the license and enable people with little investment in learning and commitment to share the same spectrum with true ham operators.

We propose a federation of real amateur radio operators who are fed up with the diminished requirements cheapening the license achievement they were once proud to have. We propose a federation of people who are disgusted with the beating that the Morse code and the integrity of the licensing examination have taken. We propose to fight back. The mountain is steep and our adversaries have been able to get better footing. We probably cannot win". It may simply be too late. But maybe we can soften how bad the impact will be when ham radio crashes to the ground. Also we can at least show those who are solely responsible for the end of the amateur radio service (which some have predicted could be within 10 years) that they personally destroyed a great communications service.

Earnest and dedicated ham operators must express outrage. Those puff-headed sycophants who we hear spewing the propaganda about "need for change" need to be challenged. Amateur radio is NOT about enabling kids to mumble nonsense on a 2-meter handi-talkie or how many secretaries in the front office in Newington got their faux- "Extra" class license. By reducing requirements and making a ham license easier to obtain DOES NOT MAKE FOR ANY SORT OF AN ACCOMPLISHMENT. Period. Amateur radio at one time was steeped in solid traditions and pride of accomplishing what it took to wear the title. Amateur radio was The Genuine Article. It was real. It had solid requirements and those who aspired to fulfill those requirements had reason to be proud of their achievement. NPRMs have repeatedly received overwhelming rejection but yet they are made into law. Why aren't they listening to the respondents? Why are the only ones they listen to the minority? The answer is this: because there is no respect for the playground weaklings.

FED UP CALLING FREQUENCIES " Bottom of "new" phone band
(e.g 3600 KHZ , 7100 KHZ
etc)

CW operators have just suffered a slap to the face by the diminished CW sub-bands in the so-called "Omnibus bill." We propose all CW operators register disapproval by continuing to use the old sub-bands. PLEASE NOTE: Before the angry emails start, understand that we are NOT advocating intentional interference to phone operations! We CAN co-exist. God knows we US CW operators have been putting up with Canadian phone QRM in our US CW bands for years. Shouldn't "What's good for the goose is good for the gander" prevail here? Why are the phone operators treated as such hothouse orchids? . For starters, on each amateur radio band, we propose the frequency that separates the CW and the phone sub-bands become a CW calling frequency for FEDUP hams to share thoughts and camaraderie with like individuals (For instance, 3600 KHz). Since CW operations are permitted from 3500 to 4000 khz, our operation on the bottom end of the "new" phone band is not violating anything. Phone operators, however, will be restricted from using this frequency since splatter would fall outside of their sub-band.

We propose establishment of an organization to be known as FEDERATION FOR UNCOMPROMISED PROFICIENCY (FED UP). To this end we are soliciting people willing to help write letters (FCC commissioners, congressmen, USA Today, agencies, manufacturers, magazine advertisers that use anti-CW publications...anyone influential to whom we can express our dissatisfaction as to what has been going on in this communications service). We are also soliciting hams with expertise in legal matters, media, business and marketing who would like to help us. Our goal is establishment of a professional lobbying effort to reverse the damage that has been done to the amateur radio service, the license, the quality of operators and the future of the service. The primary focus is re-establishment of proficiency to the amateur radio license and awarding levels of proficiency with privileges. Yes, this has been tried as recently as the last couple of years. Like we said earlier we are going uphill and it is not "politically correct" in today's amateur radio environment. But WE NEED TO BECOME MORE VOCAL. We need to stop being fainting goats. We need to get some FIRE IN OUR BELLIES and fight!

If you are interested in helping us put together an organization to challenge the horrific FCC rules and regulations and the idiotic policies that have been imposed on ham radio operators, we invite you to contact us. When we see what the interest level is we can better assess a potential group's structure. Obviously our first order of business will be establishment of a core mission and an executive staff to drive this effort. Please email us at fedup@intergate.com. Please be patient for our reply. We will respond to all serious inquiries personally. No doubt we will get a lot of moronic and angry emails, which will simply be deleted. Even so, it no doubt will take time to wade through the legitimate ones. And confidentiality will be maintained because we know none of you wish to put up with an e-mail inbox full of messages from goofballs.

We have been ignored because we've consistently lied down and complied. The bullies always pick on the kid who is most passive. We've been in such a rush to show how agreeable we are with all the "crap propaganda" coming out of the ham magazines, that we didn't even notice how the good things

were slipping away. Our attention was diverted from their erosion of technical proficiency and abilities as a well-rounded communications operator (including knowing the Morse code) while they distracted us with the razzle-dazzle of vanity callsign giveaways and a host of scary-but-bogus threats to the welfare of ham radio.

If you've got any fight left in you we'd like to hear from you.

73, ZUT and QTX

<snippety>

The only thing that truly "ails" the amateur radio service is those
who are committed to spreading messages of hate and prejudice against
those who choose a path for getting their license that said spreaders
don't happen to like.

If you're no longer happy with the HOBBY, then find another one.
Don't let the door hit you in the arse on your way out.

Hey thanks, Bill
I downloaded a few of your programs and installed them on a MP3 player.
My first attempt at such a thing, it all went smoothly, I listened to the
discusion
while on the treadmill and while working the weight machines this morning, I
enjoyed the conversation. I'll be adding more soon.
I bought a cheapy MP3 player at FYE, hold on now, list price is $29.99, it
is on sale for $19.99 and has a $10.00 rebate. So the final cost is about
$10.00!
Works fine but it is bare bones.
Thanks again for the feed,
Mike

Apparently, you mistake forbearance and tolerance for acceptance: your
post appeared in rec.radio.amateur.boatanchors, so I was reluctant to
reply because it _is_ off-topic there. I have cross-posted this reply to
rec.radio.amateur.policy, and I've set the followup-to field. I hope you
can show the readers of r.r.a.b (and the other groups you've posted to)
an example of proper Usenet operating practice and Netiquette, by moving
this discussion to rec.radio.amateur.policy.

If you are a grandfather, congratulations: having lived to an age where
that is likely, I assume you have learned that life is not always as
simple or as kind as we might have wished when we were children. It does
little good, and indeed probably does harm, to bemoan a past that is
gone forever, and it does nobody any good to insult those who disagree
with you.

> Besides that, what makes you think that a "granpaw" has lost

My Grandfather was never shy about expressing his opinion: he was a
politician, and he knew how to do it with grace, humor, the occasional
barb, and (above all) with the facts on his side.

He also knew, and taught me, the most important lesson of leadership:
when you don't know what you're talking about, you should be silent.

[remainder snipped]

IMNSHO, what "ails" ham radio is nothing more or less than the
Negroponte Switch (http://www.answers.com/topic/negroponte-switch).
Since there is no longer a need for wireless communication between fixed
points, and since cell phones and other modern-day wonders have obviated
the need for autopatches, and since the GI's overseas can now access
VoIP for calls to their loved ones, hams from "The Old School" are
finding themselves feeling unwanted and unloved as the world moves to
digital modes: technology changes, and it changes our hobby too.

In years past, society found use for our talents: ships at sea needed to
be able to call for help, natural disasters disrupted the telephone
service, remote locations found radio more effective and cheaper than
running phone lines and/or undersea cables, and even aircraft had to
employ Morse operators in order to stay in touch with shore stations.

I'm sorry, but times have changed: I climbed the mountain to 20 WPM, so
I'm entitled to say if the view was worth the effort - it was - but I
hate to break the news, OM, that you and I are obsolete.

There was a time when hams could count on help from the Pentagon at
every frequency conference, because we were a trained pool of operators
that could be pressed into service quickly during wartime. Military
electronics, however, are now so secret and so complex that troops can't
maintain them in the field: uniformed techs are reduced to doing board
swaps based on "Good/No Good" indicators from portable automated testers.

In civilian life, as well, not only CW but even basic voice training is outmoded (pun intended). Satellites have obviated the need for the radio operators at sea in almost all cases, and in those situations that still call for longwave radio, SSB has obviated the need for Morse operators: we need only look at ARINC to see proof that it works effectively. As if the satellite's footprint wasn't a heavy enough burden (again, pun intended), we see that even in Antarctica, underseas or overland fiber-optics may be used to fill gaps in satellite coverage.

Let's speak frankly: there is a natural, understandable urge to want to turn back the clock. I'm human, too, so I understand your nostalgia for a time when our hard-won skills were valued and salable: I worked as a broadcast engineer to help pay for college, and even those of us not working in radio found it easy to impress our girlfriends by ordering a pizza via an autopatch, or to horrify our teachers by quoting Radio Moscow in high-school essays. There was a time when knowing the formulas and the rules - and the code - was a sort of status symbol, and, if nothing else, we can all say that we were Geeks before it was fashionable.

Times have changed: while the code was once a part of our national defense plans, it is no longer a ticket to a seat at the frequency-allocations table, nor justification for the free goodies that I enjoyed as a MARS operator, nor even a way to impress teenagers who grew up with cell phones and don't care how they work. As an Extra-class Amateur who still uses CW, I must regretfully say that if we're to remain more than a historical footnote in the history of communications, then we must all find ways to serve our communities with new techniques and new technologies.

CW remains what it always was: a fundamental mode that allows low power, inefficient antennas, and outdated electronics to be used for effective communication. As such, it is, paradoxically, still viable for ham radio even as more well-healed users trade up to the Clarke belt. In addition, CW is proof that we obtained a difficult goal by personal sacrifice, and it's OK to be proud of that achievement: if that's what brings joy to your life, by all means keep the Vibroplex and your skills polished.

The future of ham radio is, and should be, debatable. While I hope that we hams will acquire the modern equipment, skills, and training needed to serve the public in the Twenty-First century, I'm not starry-eyed as to our prospects: the "low hanging fruit" was picked years ago. The only thing I can say for certain is that divisive, sarcastic, and angry calls for a return to the "good old days" won't do anyone any good.

William

One more thing on this. In looking at microwave xformers, I only see power specified and not a word about voltage. Are they all the same and what voltage are they?

Just a followup, I decided to forego radiomarts offer to "fix" my
"Immaculate Collectors Condition" Drake R4-C I got from him and sent it
to Jeff Covelli, (WA8SAJ) . He replaced Q-5 used for the bfo and some
shorted tuning caps, reworked the PTO and realigned to spec's and now
the receiver works great. Jeff even replaced the bluing in the meter
and dial, the white lens and put in a new dial window and rewhited the
lines on all the knobs. Three things learned from this experience:
1.)Beware who you buy from on ebay. 2.) Great help on
rec.radio.amateur.boatanchors and 3.) Jeff Covelli is the man!!!
definately recommend his services. Quick turnaround, great
communication and nice work!! Thanks again for everyones help and
recommendations---Ted---KQ4MZ

I believe the points made in the Fedup postings are pretty good. It seems like everytime
anyone objects to anything they are immediately labeled as "spreading hate and
prejudice."

Truth is, no endeavor of betterment has ever NOT started with self critique.

I do agree with the writer that hams have become hot house orchids in this
respect.

Why should anyone not agreeing with you need to find a new hobby? What gives you more rights?

Finally, for crying out loud, can using contrived words like "arse." Say
what you mean and mean what you say. If you mean "ass," say ass.

>Roger but how does one "out of phase" two transformers?

Okay, each transformer has the righthand side of the secondary tied to
ground.

So, you apply AC to the primary, with the hot on the left and the neutral
on the right to one transformer, but the hot on the right and the neutral
on the left to the other transformer. So the polarity is reversed between
the two.

Now you have two outputs, each very high voltage with respect to ground,
but out of phase. This is just like having a center-tapped transformer
of twice the output voltage, but with the center tap grounded.

Oh, I don't know..... I think you "both" may have some points. No one should be "forced" from the hobby - however - there are those whose apparent love of CW still think it is the saviour of the world and the hobby - it is NOT. CW is being used as a wedge to cause a deep divide amongst our ranks. Those who LOVE it and think it needs to stay. Those who had it but don't use it. Those who have yet to break into Amateur Radio. Should those like the OP of this thread be forced from the hobby due to their opinions? NO - but then neither should new folks interested in becoming hams - based on their lack of interest for "CW". CW has NOT kept the bands clean as some have tried to impress upon the world. It is time you admit that.

As for "finding" a new hobby..... that reminds me of so many who always say "I HATE MY JOB". OK - so go get another one! Case in point - bus drivers - I knew a few who couldn't STAND working with the public. Well - you chose the WRONG field. Go find a job you'll be happy with - then YOU will be happy, your fellow employees will be happy - your family, etc. No one will have to hear your whining. AND those you couldn't stand - won't be there - anymore.

IF you can't stand it because "CW" is being outcast - well - there is NO easy out - there. It is a fact of life - we must accept. So, either LIVE WITH IT - OR - DO find something that won't "frustrate" you - due to changes. After all - WHAT GOOD - is a hobby or JOB - if you can no longer "enjoy" it? It makes no sense to stay in it - if all it does is cause pain and hardship. There is NO sense arguing with fellow hams and casting others aside showing interest - JUST BECAUSE a mode is being antiquated. That is doing no good for the hobby OR any "person". CW isn't "THEE" answer to all the Ham problems existing - real OR imagined.

Kids today don't take to hobbies like US older people did. They're not being led down the paths - be it by parents OR teachers - to DISCOVER. In the last 10 years, I've "rarely" heard of any "Science Fairs" - which as children - most of us were implored to submit entries for. Most shop classes are shutting down - at least here they have. The ONLY source of electronics they see here now - is IF they go to a Tech school or the military after graduation. Even the Vo-Tech schools are left for those with a "C" average or better - which sucks. Children "have" to fit in educationally - SOMEWHERE. Maybe they're not that great at History, Math, etc. Maybe - like many others - they have a knack to learn what "does" interest them - be it "Mechanics", "Electronics", "Electrical". I know many who failed school but are damned good at their respected jobs of those just mentioned. They got there by learning as a CHILD then progressing through other courses they could take - even if it were "night" classes that they could "pay" to take at the "Vo-Tech" schools.

So - if kids today aren't being shown anything to spark their interest and they don't touch electronics til they get it in Tech school or the military - and I'm talking "in depth" - NOT using IPODS, COMPUTERS, MP3s, CELLS - without getting inside them - then by that time - they've WASTED many good "learning" years.

Bush talks of "no child left behind"! I have news for him - MANY ARE - around here - the emphasis is on FOOTBALL - to hell with Academics. AGAIN I say - of say 10 graduating classes - hundreds of students - DOZENS of football players OR basketball/baseball for that matter - "MAYBE" one gets a scholarship to college for FOOTBALL (or the others) and MAYBE he may go to the pros. I've known MANY good players and they went no further than high school. These players were touted as great by coaches, parents, umpires, etc.
They're working for a living just like the rest of us. With our Educational system NOT pursuing the arts of metal, electrical and so on - we will eventually fall behind in skills. History, Math and so on - are great - I'm not knocking them - but SOMEONE has to learn the skills!

CW is DEAD. CW has gone the way of smoke signals and war bearing tom toms. Fighting for the survival of CW is like fighting to keep a person alive for eternity - it ain't happening. Accept life and move on. There is NO sense making enemies over something so ridiculous - especially with those you don't even know.
You LOVE CW? Fine - USE IT - contact anyone you can on the bands in CW. ENJOY IT! No one is forcing you to NOT use it or enjoy it. Personally, I'm not into CW - but I do tune in once in a while. But I'm not going to tell others to NOT use it or learn it - that is a matter of personal choice.

4715. WTB. Hammarlund SPC.10 SSB Adaptor

4716. Gonset GSB-201 improvement

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-12-15 18:44:14 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <4582ecff$0$19106$4fafbaef@reader4.news.tin.it>
Source record: 9766

This message should be of interest for GSB-201 owners running on a 50-Hz power line.

At 50 Hz, during receive the high voltage stays at about 2,000V. During transmit instead, the four-811As idling current is sufficient to bring voltage down to the normal value (about 1,650V). So, most of the time voltage stays at 2,000V, thus stressing the electrolytic capacitors and causing a higher dissipation in the bleeder.

Such problem is due to the fact that the GSB-201 input-choke power supply was designed for 60-Hz operation, and the choke inductance therefore results to be too low, at 50 Hz, for keeping voltage down during receive. Replacing the choke with one of higher value would be a crazy choice, and using a lower-value bleeder would cause undesirable extra heat.

So I decided to try converting the GSB-201 input-choke power suppy into a resonant-choke power supply, putting a high-voltage capacitor in parallel to the choke. After cut and try, I determined that the precise capacitance value that resonates the choke at 100 Hz (i.e. twice the mains frequency) is 110,000 pF. I used a 3000Vn capacitor (not 3000 Vp) which should be safe enough.

Now voltage stays normal in all conditions.

I am not sure whether all the GSB-201 series utilize the same choke; anyway trying different capacitor values is quite easy, as the choke leads are easily accessible from the amplifier top, and the choke is on the negative side of the supply (you should anyway be very careful because of the high voltage across the capacitor. Moreover, capacitors should be discharged by shorting the leads every time they are removed after a test).

Repeat as I dont think the last one went in.....

I have had these from new, bought in Canada just before I left.

I cannot use them now as I have severe emphazema so cannot talk for long

and severe arthritis so cant send CW.........

HF set is a Kenwood TS-440SAT with all filters and auto ATU. I can
demonstrate the power out into a dummy load and on air on the higher
Bands only as for some reason it will load into my Discone.... My G5RV

came down in the last high winds and as I have not used the set in
earnest for many years no point in replacing it.

The 2m/70cm unit is a ICOM IC-3230H, 50Watts on 2m and 30Watts on 70cm
I probably only used it some 20 times, as I ran packet with another 2m
radio.

A Drae 20Amp power supply that comfortably runs both rigs.

Boxes, connectors, mics, mounting brackets, books etc.

Sale MUST be as the complete lot as both rigs depend on the Drae PSU.

PICK UP ONLY from Norwich as I dont get out a lot and cant ship them

For the present I am keeping the packet setup even though my BBS has
gone thataway at present.

I dont know what they are worth now, I had spent some 2000 pounds on
them!!

Offers, and Please, Walt, no flaming as I am too ill to care...

Rex in Norwich

Whatever the case - we all know how this thread got started - and if you forgot - read the title. AS OF 12/15 - the FCC has all but eliminated MORSE CODE (CW). It is no longer required on tests..... So - CW Advocacy group - GET A GRIP. As I said - if you love CW - go for it - use it all you want - there are many who still do use it. But it isn't worth it to make enemies over a mode - WE had no choice over. The FCC made it a part of Ham - and the FCC took it away as a part of Ham. WE had nothing to say. ENJOY your commaradery with your fellow hams and forget this FOOLISH argument - once and for all - IT IS OVER. DEAD.

4723. Q-multiplier for Mosley CM-1

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-12-16 15:54:07 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <458416a0$0$22389$4fafbaef@reader2.news.tin.it>
Source record: 9773

I heard of a local guy who was using a Q-multiplier in conjunction with the Mosley CM-1 receiver. It seems that Mosley never built Q-multipliers. so he probably adapted a device of another manufacturer.

I searched Google, but I could not find any reference to which Q-multiplier would be suitable for the CM-1.

Does anyone have experience with using a Q-multiplier with the CM-1, and knows how it should be connected to the radio?

Thanks & 73

Tony I0JX.

There's nothing special about a Q-Multiplier. It's a single stage
regenerative amplifier added in parallel to the receiver's existing
IF, and as you turn up the regeneration the single coil that it
has gets quite selective (but, it's not a particularly sharp curve).

You'd attach it to the plate side of the mixer tube, and either power
it with it's own power supply or grab some power from the receiver. There'd
be an on/off control, and a regeneration control. Some got fancy,
and provided a notch function.

Assuming the Mosley uses a 455KHz IF, then pretty much any Q-Multiplier
will work. And the construction articles and manuals would all include
some general detail about attaching it to a receiver.

Most were based at 455KHz, because that's where most IFs were. And of
course, those receivers that had a lower IF were in less need of a bit
of oomph in the selectivity department, while except for things like
BC-348s with 910KHz IFs, any receiver with a higher IF would likely
not benefit from a Q-Multiplier (because the center frequency was
high enough that even with regeneration a single coil was too broad,
and also receivers with higher IFs tended to start with decent
crystal filters).

Any of them should be fine. They just conect up to the IF strip.

>Does anyone have experience with using a Q-multiplier with the CM-1, and knows

Personally I have always found Q multipliers a damn pain in the neck and
I'll take a mechanical filter or even a narrowband audio filter any day.
But there is a section in the old ARRL Radio Handbook about building one
and hooking it up to a typical receiver IF.

I have a Q-multiplier both in my Drake 2B (external) and in my Hammarlund HQ-110 (internal).

Anyway when one connects an external Q-multiplier to a receiver, perhaps something has to be changed. For instance the connection cable capacitance may cause a non-recoverable detuning of the IF transformer, or other problems. That is why I was looking for someone who had a direct experience in connecting an external Q-multiplier just on the CM-1, to know whether he had any problem with that.

Dear OM's

I'm looking for pictures, inside and outside, of the SOE station Poundon and Grendon-Underwood.
These stations maintained contact with operatives in occupied Europe during WWII.

Who can help, please?

Hi,
There's a fairly active RCA email list that really is mostly on the
AR-88 and it's relatives. RCA@mailman.qth.net or General information
about the mailing list is at:
http://mailman.qth.net/mailman/listinfo/rca
One of the guys who frequents there may have already made up a
"survey" like you intend. Many of the contributors are from down under.
I have one, have it 95% back in good operating condx, need to clean up
a few details, somehow got sidetracked a few mo.s ago.

4733. Tube-based 40M VFO

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-12-16 22:33:44 UTC
From: shoppa@trailing-edge.com
Message-ID: <1166308424.626409.253280@f1g2000cwa.googlegroups.com>
Source record: 9783

I've been having a lot of fun the past few weekends with my "new" Eico 720 and a couple of 40M crystals and a dipole strung between two trees.

But now I'm tired of QRM'ing the same frequencies all the time and want to build a VFO. I've got some random variable capacitors, a couple of nice dials, and would love to spend a weekend punching holes in a chassis and putting something together.

I look in the 50's and 60's era handbooks and am a little confused. The "SSB exciter" construction articles almost exclusively use a Vackar VFO made out of a twin triode. Looks really straightforward and simple. But the cookbook section inevitably shows pentodes in usually both grid- and plate-tuned circuits, and then with extraordinary amounts of buffering (say, a cathode follower AND a buffer amp).

I don't anticipate doing anything but 40M and some 20M in the near future, and the Eico will double up to 14Mc just fine from 7Mc.

Will probably use a 0A2 type regulator in any event.

Am I giving up anything by just using the simple twin-triode Vackar? The Eico 720's crystal oscillator combined with the crufty old crystals I had isn't perfect to begin with, remember :-).

I'm guessing that all I need is 5V or so to drive to the Eico, correct me if I'm wrong! With the crystal oscillator in it I almost always have to back way way down on the grid drive so I'm guessing I've got some extra oomph if I need it.

Tim.

Hi,

You might look at the matching Eico 722 VFO manual on BAMA:
ftp://bama.sbc.edu/downloads/eico/722/

Heathkit sold 3 Q multipliers, one without built in supply (used power from
the rig), and two with built in supply. They work GREAT!! I even plugged
one in to the filter-less KWM2A transceiver. For the Drake 2B and 2C, the
matching qmult/speaker is a 'must-have' accessory.
You can emai me direct if you want more info.

Look at the Heath Q-multiplier manuals on BAMA. They answer all of the hookup questions, since they were designed to connect to any receiver that used a 455 kHz if. Heath Q-multipliers are cheap and plentiful. I have a couple sitting on the shelf.

it would be an easy install and give you a few more knobs to twiddle. The CM-1 lacks knobs to twiddle and selectivity.

4743. Atlas 210x carrier oscillator board and S-meter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-12-17 16:08:23 UTC
From: "Al, N1AW" <awoodhull@hampshire.edu>
Message-ID: <1166371702.978961.322510@l12g2000cwl.googlegroups.com>
Source record: 9793

An Atlas 210x is not really a boatanchor, I think it might even float for a while if thrown overboard. But it is of mid-70s vintage when many full power h.f. rigs were really boatanchors, so I hope someone here might be able to help.

I have a problem with the c.w. offset on an Atlas 210x which could be due to component failure on the PC-600 carrier oscillator board. This board is mounted in such a way that it is impossible to access, or even to see, most of the components on the board, although the foil side is accessible. I have a manual and a schematic, but no diagram of component placement. Without a picture of the component side, and being unable to see it, it is hard to relate the accessible foil pattern to the circuit for voltage tests. Also, if I need to replace a component I'll need to remove the board.

One of the screws that holds this board in place is not accessible unless the S-meter is removed, and I can't see how it is held in place. So, I wonder if anyone can supply or point me to instructions for removing the S-meter and the carrier oscillator board and/or a picture or diagram of component placement on the board relative to the foil pattern.

I posted a message similar to this on the yahoo atlas210x-215x group, with no reply from that group so far.

Thanks in advance,

Al, N1AW

4745. BAMA Notice

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-12-17 17:11:38 UTC
From: Kenneth Grimm <kgrimm@adelphia.net>
Message-ID: <eguao2l3q0llqpt7cpguqgulq51elms8rr@4ax.com>
Source record: 9645

Notice: Effective January 1, 2007, BAMA will add only manuals with a direct connection to the tube era of ham radio. Only manuals for amateur radio transmitters, receivers, antenna tuners, antennas, keyers, etc. will be added to the collection. The only test equipment that will be added will be those items already listed on the "Needed" list and those items created especially for the amateur radio market.

While I appreciate all the contributions of those whose interest is in test equipment and military equipment, I simply cannot continue to expand the BAMA collection in these areas at this time. I will not be removing the test gear and military manuals currently on BAMA. The BAMA collection will remain intact. I just won't be adding to these areas for the time being.

I want to thank any and all of you who are reading this and have contributed to the BAMA collection. Without your time and effort, BAMA would not have been possible. Thanks again and best wishes to all for the holidays.

I understand there may be a storage problem for the
site. I, for one, have found the test equipment literature
you have to be very valuable, much of it unobtainable
elsewhere. I hope you will be able to reverse this policy in
the future.
The site is a unique resource and I thank you very much
for it.

Without knowing something about the signal that you think caused it to pin,
it's hard to tell if the signal really caused it or if the meter drive
circuit is faulty. I hope this isn't too subtle.

Why not also require that diagrams must be properly scanned. Many diagrams on the site can hardly be read.

People tend to use lossy compression methods (jpg, djvu) that are generally unsuitable for schematic diagrams. Probably this is an heritage of times when hard disks had limited capacity and we were still using 56k modems. Today using djvu or other compression schemes makes little sense. For black and white, gif or png can give a perfect reproduction with no big files.

At best the post might be considered to be a poor attempt at humor.
Wikipedia has an extensive discussion of internet trolls and the post
scores as the product of a troll in more than one way. Hopefully this
is direct enough that you can understand its meaning.

For what it is worth the elimination of the CW test is probably 30
years too late, but it is a step forward. Next problem to be tackled
is the remainder of the test. Essentially it should be scrapped and a
single test should be developed that checks for: 1. knowlege of radio
theory. 2. The prospective ham would be required to set up a ham
station in a safe manner and would be required to demonstrate the
ability to operate on a concise and courteous manner. One he passed
those components he would be given access to all ham bands.

And existing licenses would be grandfathered in for full coverage.

Given the lightning speed with which the ARRL, FCC and the hobby at
large has responded to the morse code problem i would guess it will
take another 70 years to tackle the remainder of the test.

DejaVu seems to be the problem. It _does_ produce very
small files but they are, as you state, of rather low
quality. PDF's are much better but are 4 or 5 times the

size even when set for fairly high compression. PDF's are quite satisfactory. I don't like multi page publications posted as a series of JPG's. They can, of course, be converted to a PDF for printing by using a program like PDFCreator. This is a small freeware program that appears as a printer. One prints the desired documents to it and it produces a PDF.
I can understand Mr. Grimm's problem: he is moving, will not have a high-speed connection, and has limited time to oversee the site. I think this site is a tremendously valuable resource and he appears to be doing whatever he can to maintain it. I hope that in the future he will be able to return to offering test equipment manuals. I think we should appreciate what is there and the amount of work that has gone into creating and maintaining it.

Any recommendations on a 1.5V battery for an RCA WV98C VTVM? I'm wondering if one kind of battery is better than another in terms of leaking, etc. I realize just about any 1.5V battery will work, but want one that will last the longest and be the safest against damage should it be left in for too long.

Thanks,

Barry - N4BUQ

The Alkaline cells are sealed the best, but I have had trouble with all of
the manufacturers for leaking. I generally think that Ray-O-Vac is the worst,
followed by Eveready, and DuraCell is the best for leakage.

The big problem with the cell in a VTVM is that if you leave it on ohms, it
will discharge the cell. Also, the usual VTVM circuit draws over 100ma
from the cell when you are in the RX1 position, and short the leads.

Good question I would like to see the answer to this also. This site is to valuable to the antique collector anymore to be on one server or even controlled my one person. How can sites like this be save for future generations that might find a need to use them. I hate to see this amount of effort go away for ever when one person get burned out or dies.

Gregg,

I have more storage capacity than I will ever need and I'm running the
main site on a DS3. Thanks again for the offer, but I don't need any
more big drives and pipes. I need more hours in a day.

Hi Ken,

Considering the audience that BAMA has, I should think it would be very
easy to find a few "little elves" that could help you out with the mundane
tasks that such an archive requires. That is, after all, how Linux, and
all of the open source software got written.

To be entirely fair, many of the originals weren't widely available in
good quality either.

Many times I have an old photocopy of an old photocopy of an original
schematic, and I can't read the part values either. Sometimes the
originals (especially for ham equipment, not so much for test
equipment) that came in the manuals were barely readable too.

> People tend to use lossy compression methods (jpg, djvu) that are generally
> unsuitable for schematic diagrams.

This is certainly a huge factor. Look at the scan qualities at
bitsavers.org for example and you see that careful attention to
scanning and lossless compression are very worthwhile goals.

Tim.

I guess repeaters in general, whether it GMRS, commercial, or Ham, will still
use CW identifiers, they even use it on satellites.. It seems strange, but it
will be that way for a long time.

Listening to the bands these days I have come to the conclusion that
many Keys have indeed become Silent although they are not physically
dead.

And yes, when more code operators die they are just as dead as any
other amateur radio operator who has passed away.

FWIW - when one "presses the mic button to talk" - they are considered to be
"KEYING" the mic. Therefore - anyone who is a ham - be they a "code" key
user OR "key" a mic - would still pass as a "silent "key" "
The code is GONE - there is nothing we can do about its demise - so lets
start PROMOTING decent Radio Skills - beginning with the vanishment of
insulting amongst the ranks first off - and those who "might" be considering
coming into the hobby.

well said indeed althought still maintiain I will an SK only over my
dead body

and Intend for that never to happen even have a plan to carry it out
chinese say "man who finishes house dies" therefore I will never quite
finish my home and live forever

but seriously the attiudes and "proCoders" were one of the biggest
things working in favor of NoCode

Code use is now in the hands it should be in those that suport it .
well on second even I, and I do hate the mode personaly would wish it a
better fate than its supports are likely to contrive but for good or
ill it their problem not mine

but insulting those you are requiting ro seeking to convince was never
a good idea I hope they learn that soon

I beg to differ, but the CW bands are a lot cleaner than the phone bands....listen to any of the squid-bait on the lower phone bands. There are good and bad cw and phone operators, but I find much better operator skills and civility in the cw only portions of the bands. Most cw operators don't find the need to banter, nitpick, name-call, harrass and the like . I use phone and cw and admit to preferring cw, but now that the phone bands have cut into the cw portions of the band , now I will have to deal with less space to operate in unless I work around the splatter and garbage generated by more useless phone nets and banter.....my 2 cents----Ted---KQ4MZ

> to build a VFO. ...

If you are building a VFO in a separate cabinet you will do well to make it solid state. Two advantages are much less worry about drift due to heating, and powering it easily from low voltage batteries. That will ensure a pure note, and, particularly if you are new to home brewing, not having lethal voltages on the circuit is desirable.

I once had an Eico 720 but I don't remember the circuit. If it doesn't have an input jack for a separate VFO you may need to make a slight modification to be able to feed the VFO to the tube that was originally a crystal oscillator.

> I'm guessing that all I need is 5V or so to drive to the Eico, correct
> me if I'm wrong! With the crystal oscillator in it I almost always have
> to back way way down on the grid drive so I'm guessing I've got some
> extra oomph if I need it.

A transistor oscillator of any sort (see the Handbook) followed by a buffer stage should have no problem providing enough drive. Back in the 1960s and 1970s I used such a VFO to drive a Gonset Commander, a rig more or less comparable to the Eico -- as I recall the Commander had a 6AG7 crystal oscillator driving a 6146 final.

OK, just to clarify a point I made below AND a few times - the bad operators I spoke of - were NOT in the CW portions of the bands - they were operating SSB. Still - they were BEFORE NO CODE was even brought about.
The majority were General class and above - CW 13 or 20 WPM operators. So - maybe CW kept the CW portions clean - but it had little effect on the SSB frequencies. So, I still believe that CW did little to keep the bands "clean".

Washington D.C.-

It was announced today that Kellogg's and the Federal Communications Commission have signed a pact to issue Amateur Radio Licenses on specially marked boxes of Corn Flakes.

In this unprecedented move the FCC believes this will not hurt amateur radio but allow all individuals to receive an Amateur Radio License without having to demonstrate any skills with the exception of being able to use a pair of scissors to cut out their operating permit from the breakfast cereal box.

Kellogg's spokesperson commented that they were proud to have been selected by the government to be the issuer of licenses for Amateur Radio in the US and hope to soon make an agreement with other cereal loving countries. They also expect that will be issuing certificates of achievement for DXCF for confirmed contacts with 100 corn flakers.

Well, it's not that extreme. Is AM gone? (No, it just isn't very popular
among the current crowd.)

Is RTTY gone? (No, it just isn't very popular among the current crowd.)

Is packet gone? (No, it just ... etc, etc, etc)

I'm going to quit now before I get too obvious :-)

I didn't mean CW was "gone" in the sense of no longer able to be used! I meant only in the "testing" - which has spawned months if not years of hateful arguments - so it is pointless to remain at odds with others over it. Sure - CW, AM, RTTY, etc - are still all there to be used and enjoyed by those with personal preference. And as well - they should be! Use them to your hearts content!

Bill

Washington D.C.-

It was announced today that Kellogg's and the Federal Communications
Commission
have signed a pact to issue Amateur Radio Licenses on specially marked boxes
of
Corn Flakes.

In this unprecedented move the FCC believes this will not hurt amateur radio
but
allow all individuals to receive an Amateur Radio License without having to
demonstrate any skills with the exception of being able to use a pair of
scissors
to cut out their operating permit from the breakfast cereal box.

Kellogg's spokesperson commented that they were proud to have been selected
by the
government to be the issuer of licenses for Amateur Radio in the US and hope
to
soon make an agreement with other cereal loving countries. They also expect
that
will be issuing certificates of achievement for DXCF for confirmed contacts
with
100 corn flakers.

True, but it was a little wide.

OTOH some power companies run great spark transmitters.

>
> Am I giving up anything by just using the simple twin-triode Vackar?
> The Eico 720's crystal oscillator combined with the crufty old crystals
> I had isn't perfect to begin with, remember :-).

As a followup:

Built a circuit using a 6AH6 for the oscillator and a OD3 for the screen regulation and a 6C4 for an output buffer, and a little Allied transformer (yes, they still sell tube power transformers) for the power supply. The grid circuit resonates at 1.75Mc, the plate at 3.5Mc, and the Eico doubles this up to 7.0Mc just fine.

Right now not everything is bolted down completely, but maybe over Xmas it'll get a nice old Millen dial and a spiffy sheet metal box.

Had a very nice QSO on 40M last night with another guy who homebuilds VFO's, he used the twin-triode Vackar type I was considering. I'm so happy to be back on 40M with a VFO that I don't know if I'll ever bother doing bandswitching, but I suppose I could double up in the 6C4 to get to 7Mc out of the VFO and 14 or 21Mc out of the Eico.

Result seems generally superior to the 720's built-in crystal oscillator, which is actually pretty crappy with a lot of chirp on dashes after the rectifier gets warm. Or my ancient 40M crystals were crappy. The lack of screen regulation on the 720's oscillator is probably what made it so bad.

Tim.

4793. Help: Halli HT-44

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-12-20 23:19:24 UTC
From: Steve <zarco@sonic.net>
Message-ID: <4589c500$0$80062$742ec2ed@news.sonic.net>
Source record: 9693
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono

I've been trying to restore an SX-117 and HT-44 to use as
a vintage setup. Its been a challange! Seems that everything
that could go wrong has, and in ways that have driven me nuts.

One of the last issues is with the HT-44. The output stage
wants to break into oscillation at (about) twice the freq
its tuned to. I have been unable to neutralize the finals.
The tubes are good (and matched), band switching has been
checked (switches and coils), bypass caps, etc. Everything
looks OK. All of the obvious stuff has been checked (biasing,
power supplies, etc).

Hopefully there is someone out there that is familar with
the HT-44, and may have seen this problem and found a
solution. Nothing useful was found with a google search.

Steve

Roger:

I guess your little "news item" is symptomatic of most us remaining hams. I had forgotten about "cereal box offers." I'm guessing most younger people never heard of them.

I've worked at my present job for three years, and I have yet to write a letter. Times have changed -- for 'offers' and for ham radio. No matter how much boatanchor junk we accumulate, we can't turn back the clock -- wish we could.

K9YA Telegraph
The Good News About Amateur Radio

January 2007 marks our fourth year at the K9YA Telegraph.

As we wrote at the completion of our first year:

"Our success derives from you, our large, enthusiastic and devoted subscriber base worldwide, and to the writers whose contribution of personal stories-at once fascinating, humorous, enlightening and compelling-made the Telegraph staff's inaugural year one of consistent joy and fulfillment."

That truth remains unchanged, but ever more encompassing as more of you, drawn from the international ham community, have joined the Telegraph readership and lent your experience to enlighten, evoke and entertain.

The Telegraph staff continues in its fourth year-as in our first-ebullient. Thank you for your messages of praise and encouragement, and remember: we're always on the lookout for your good story, or two.

Very interesting reading. Regarding the translation, though, when some co-workers helped me translate another Chinese MIL radio manual, some of the phraseology came out just like the referenced post did. Literal translations for other than direct technical date are rough to work with. And... if you think the manual, per se, was tough to decipher and/or humorous, you should have read the translation of Chairman Mao's preface memo in my manual!!! Now there was a memo!!! HI!!

Very amusing translation and also the pictures, especially the tuning dials.
The tuning gear, general layout and screening seem authentic (ie as the RCA
model), but the valves (tubes) seem not to be. There are screened miniature
valves in the RF section and (octal) glass valves elsewhere. The original;
and as far as I know, metal octal except for the rectifier and voltage
regulator glass octal.

VERY Clean chassis and cabinet was repainted, Looks great.
Front panel looks nice.
I got this from an estate and I
brought it up on a variac. Puts out about 40 to 45 watts
Has the papers caps in it. So I would think the new owner would change
them.
Make offer, ready to sell.

This is a very interesting web site. One can figure out
the translated text reasonably well. Some of the odd word
substitutions actually make some sense, for instance
"aircraft" or "plane" for radio, after all the radio is sort
of dealing with signals flying through the air. I think
"loom" means "band", again a sort of connection if you think
of a cloth band being made on or a part of a loom. Automatic
translation of a pictographic language is something of a
tour de force.
The AR88 copy looks well made from the photos.

<snip>

You should check the brand of the final tubes.
GE 6DQ5's will neutralize quite differently than RCA's.
You can see the difference in the construction -
some 6DQ5's have a U-shaped clip at the top mica,
surrounding the plate lead, and some don't.
(I think the U-clip is connected internally
to the screen). If you mix the two types, you will
never get the final stage to neutralize.
Some rig manufacturers caught on to this problem,
and specified which brand of 6DQ5 to use in their rigs.

William,
He's probably looking for the "bare" ones from that era. They look like a flat block of phenolic with contacts riveted to each end.

Playthings of Past has boxes of them, used. (I drooled over many of the chassis that they came from). There may even be some NOS ones available. Many of those caps were punch stamped with the value on the metal ends, sadly many were stamped in ink on the phenolic that faded completely over the years. You might try contacting Gary Schneider (PTOP) to get the sizes you need. Check the website first to see if they are listed. www.oldradioparts.com.

This is not to be confused with Mark Oppats site, www.oldradioparts.net. Both are very valuable resources for vintage radio parts. Gary has always leaned toward battery set parts, power transformers, and other hard to find OEM items. Mark is, of course, The King of Kontrols,... and capacitors, ...and dials, and... Bookmark both links and you'll have many of your radio parts needs right there at hand.

Best of luck on your project.

There's a new TOM SWIFT group, and you're invited!

Remember this thought provoking youth science and technology fiction series?
Here is the place to meet others that were fans also. The address:
http://groups.yahoo.com/group/Tom-Swift/

We would like to invite you all to join a new Tom Swift discussion list,
launched this month:
This is a friendly gathering place for fans of any or all of the 5 Tom Swift
Series written over the last century under the pen name Victor Appleton. Any
aspects of the books and related materials are fair game, including
discussions of the stories, collecting, fanfic, model building, historical
and scientific context and anything that might be of interest to "science
minded boys" of all ages.

It is our intent to keep this as open a list as possible with only enough
moderation by diverse group of moderators to maintain a friendly
environment. Polite and civil debate is welcomed and encouraged.

Ed,
Thanks for the tip. Both are GE, and they appear to be
closely matched. Yesterday I went though some of my
stash of tubes to see if I had another pair. No luck yet, but
I've got several more boxes to go through.

Frankly, I'm running out of things to try.

4824. FA: Ten-Tec 940 TX/RX 160m converter for Triton IV

Newsgroup: rec.radio.amateur.boatanchors
Date: 2006-12-23 20:46:16 UTC
From: Dave Heil <k8mn@earthlink.net>
Message-ID: <sAgjh.6068$X72.5874@newsread3.news.pas.earthlink.net>
Source record: 9724

For Auction: Ten-Tec 240 TX/RX 160m converter for Triton IV
(and possibly other Triton models).

This little box enables the Triton IV to transmit/receive on 160m with
the Triton's bandswitch in the 80m position.

This seems like a good time to introduce one of my other life-long hobbies. In 1955, I accomplished one of my first major life goals. I passed all the tests for an Amateur Radio License. It was just the entry level "Novice Class" license but it allowed me to "talk" via Morse Code to people all over the world with simple equipment that I built myself.

Check the link at 1030 EST Dec 26 it appears to be broken. I am
interested in seeing it since I was licensed only a short time
afterwards. My ticket issued Jan 56, but test done in 55. I was then
K9CAH so I was also licensed in the MidWest in Wisconsin. I was
13.

Be sure to read the product manual! Its a real joke - 'magnetic circuitry' indeed.

And of course one or more of you knuckleheads out there reading this will swear you are getting great fuel milege because you too have a magnet strapped to your fuel line......

4834. Re: totally OT : but how can people believe this nonsense

If your experience is true, the chances are that being conscious of the need for fuel economy is making you drive more economically (eg not accelerating and braking hard alternately) which has been proven to be the biggest saver of fuel. If fitting magnets really helped things (as proven by lab tests with controls) then competition would quickly determine that manufacturers would fit them and trumpet the appropriate claims, possibly dressing them up in some way to avoid the suggestion of "common or garden" magnets that you could fit yourself.

Source record: 9735

Name: Kirill
Call: VE3AXC

Merry Christmas and Happy New Year everyone! I will be a subscriber of this forum from now on, so nice meeting everybody!

On this note, please allow me to stray a bit off this forum's topic but my info might still be relevant for some. I myself have been a ham for 8 years; also run a small QSL card printing business (my printishop is located in Toronto, Canada) and have a web site specifically dedicated to that www.qslcanada.com

Reason I would like to post this message on this forum is to let your group know that I have a pretty good group referral discount program.

The idea is quite simple and there is no catch.... For each HAM who is referred by you and who wishes to place an minimum order of 500 cards, you would receive 100 (custom designed) cards of the same type free of charge. The offer is transferable, so if for example you let me know that you don't need any more cards, I will be happy to print additional 100 cards for your friend free of charge (or charge for 100 cards less)

This offer may be ideal for your group or a club you belong to. For example, if you
refer say 3 HAMs who would like to print a minimum 500 cards for themselves, you would receive 300 cards as appreciation for spreading the word about qslcanada
; you could transfer it to someone as a gift ; or each of 3 Hams would only pay
for 400 cards, since each one will get 100 cards free. To sum it up, each of the referral counts as 100 free cards in any shape or form. Pse let me know if you have any questions.

So if bunch of Hams in this group who are into QSLing might be interested to giving someone a free gift or getting a good deal on the next batch, pse let me know. The offer is valid any time in future. www.qslcanada.com has quite a bit of samples, more info and e-ham reviews

PS Have got to mention this, since it did happen before, where some folks took this posting too personally. I just wanted to get this info out there ONE TIME ONLY! Please don't call me any spammer names or hate mail me. I believe this to be a fair group offer any hams by hams enterprise deserves a little exposure to start out with.

I will try to participate in this group from now on, so best 73 to everyone! Happy New Year!

And your link to a legitimate and peer-reviewed scientific study
proving that magnets on the fuel line really do improve mileage is
where, exactly?

No? Didn't think so.

PLONK!

Hmmmm........ - does it come in "Raisin Bran"? I'm ok with Corn Flakes, but
prefer Raisins. Wheaties aren't my favorite. Hey wait - what the hell am I
saying - I've already got my Extra - from way back when! Damned.
Guess I'll have to wait for the next exciting offer. Maybe a free radio!
Could always use one of them.

Or perhaps a bed blanket with magnets sewn in.
The amazing thing here is that orientation and flux don't seem to matter.
It's simply magnets.

Sent email inquiry to ICM and they came back with a very quick reply.

Each crystal would cost about $57.00!!! Yikes!!
Sounds like it is time to kludge up an oscillator.

Thanks for your help.

That seems a bit high -- but maybe an odd crystal holder? or
high precision spec?

I would also try JAN crystals -- for price shopping.

I am not familiar with the National -- odd crystal holder?

OK, Bob I see - what you are doing (in your update).

I just dealt with this issue on my Drake R-4C. Pain in the %@*$ to track
down -- I had to replace 5 crystals and 1 carrier oscillator crystal -- that
had all drifted badly over past 30 years (looks like the crystal batch from
ERIE for this late serial number 27xxx aged poorly).
Good news is that 6 new precision crystals from JAN -- and it is running
very well again !

National NC-300 Information from Nick England, KD4CPL - Chapel Hill, NC
http://www.virhistory.com/ham/nc300/nc300.html
http://www.qsl.net/n4xy/rcvr_national.html
http://bama.sbc.edu/national.htm

First IF frequency is 2215 kHz
Second IF frequency is 80 kHz

SO, 2215 is the crystal filter and
2295 is the second IF conversion oscillator (that is important !)
I would guess that 2135 is the other (low side) oscillator.

Fairly important and this problem was mentioned in the NC-300 service
bulletin (FSN-48) --
circa August 4, 1958 - adding crystal control to remove drift problems !!
(BAMA) -- page 16 of 18

Make sure that ICM did not quote you for:

1. A high precision crystal (they may do that for this one since it
determines IF)

2. Entire L6 assembly
(Replacing the entire L6 shield can -- as described in W1FSN NC-300
revision - page 18 of 18)
ftp://bama.sbc.edu/downloads/national/nc300fsn/300fsn.djvu

ICM likely has the documentation for that entire mod -- and may be
referencing that -- and may be more than you want.

When it comes to gas-saving gizmos, it's like religion--you're either a believer or you're not. And like religion, belief is based on faith, not evidence. Magnetic fuel-line devices for boosting gas milage have been around for decades, as have other gizmos claimed to improve MPG (e.g., using fuel-line heating, fuel-line cooling, ionization, etc.). The EPA has tested more than 100 gas-saving devices--under controlled conditions--and hasn't found a single one, including four magnet types like the one under discussion, that measures up to its claims.

For more info, take a look at a fact sheet recently published by the Federal Trade Commission on gas-saving devices at www.ftc.gov/bcp/conline/pubs/autos/gasave.htm. Consumer Reports has also looked at gas-saving add-ons and found them wanting.

Believe if you want, but these things are pure snake oil. And they don't all fall into the "well, at least it's not hurting anything and it might help" category. Some, like additives that get dumped into the fuel or oil, can damage the car.

Extraordinary claims, as Carl Sagan said, require extraordinary evidence. It's ain't there.

Oh yeah, I have seen a lot of that stuff too.
The fact that 'happy-go-lucky' actually believes that he is getting better fuel ecomony because a magnet is strapped to his fuel line is utterly amaxing.
And that he comes out swinging to defend his completey undefendable beliefs is just more testament to how utterly pathetic a human being becomes because of lack of any science knowledge.
But he offers no rebuttle or debate to defend his claim. Just little insulting jabs.
Literally a country bumpkin that used to be had at county fairs or now by TV evangelists and cults like scientogy.
The macaroon that believes something because it is printed.
But I wish I had a whole bunch of 'happy-go-luckies.'
They make great worker slaves.
If you tell them they are doing a good job for the good of the company they will work until they drop dead - and for mimum wage!! HA HA HA.
They just can't see that they are like the tools they use. Or maybe just as dumb as the 'box of hammers' we hear so much about...
But wow do they have 'faith' placed in the weirdest things. And I do not mean religion.

I know this rig is not considered a boatanchor but I know there are many helpful gents in this group with lots of knowledge on radio that have helped me out before.

My question is, how can I drop the power on my TS-140s? I am all cw op here and seems on cw its either all or nothing, a slight movement of the rf slider brings it up to over 100 watts and its hard to control the lower range. I would like to max out at around 50 watts.

Any ideas?

Thanks, Gil

Why do you demean him? Some very smart people believe very strange things. Sir Arthur Conan Doyle, he of the Sherlock Holmes tales and obviously a writer who understood logic and reason, believed in fairies with little wings, like Tinker Bell. It was because of a hoax by two children who planted fake photos of winged nymphs outdoors where he could see them, but not close enough to inspect.

World-famous scientists have been taken in by "mindreading," mental spoonbending, and other stage fakery that is part of any good magician's trick bag.

Totally rational, intelligent people subscribe to aura therapy, which involves passing the hands around the "patient's" body without touching it, even though an experiment by a 9-year-old girl completely disproved its validity a couple of years ago.

How about we stick to the pros and cons and not make personal attacks? We're way OT as it is.

One possibility without having to go inside the radio. I believe the
140 has an input for external ALC
voltage from an amplifier. An old trick is to use a battery and pot
to provide an appropriate voltage to cause the power output to fold back
to the desired level. This is typically a few volts negative.
John

Another item I've not seen mentioned - maybe I missed it - are those "Copper Bands" or "Magnetic Bands" that people wear to improve Arthritis and such. I think the majority of us know the real truth; however - you're going to be hard pressed to convince those who believe in said items - of them "not" working.

So - though "we" may not buy into it - as long as they're willing to spend their money and if they have what would be deemed "faith" - not tied to any religion - that the item works - God Bless them! At least to them - they're getting results for the money they spent. And, that is all that truly matters!

Many people believe in Psychics too - that they can tell the future. IF they were so "psychic" - we would have a lot more lottery winners. They would continue to give the lucky numbers and they themselves would be playing it as well. Oh but wait - they claim they aren't allowed to do such things! BULL CRAP. That is an easy out for their explanation of NOT being able to predict anything. Point is, many still go to these people. There will ALWAYS be snake oil sales pitches - both real items (copper bands, gas tank

magnets, etc) and the imagined (psychic tales) - and their will always be those who believe in such things to support the trades as they apply. It has been that way for centuries, why change now?

Therefore - there is no need or reason to defame or demean any one for their own beliefs. As the man said - there are many "prominent" people who follow those paths. If they're happy, who are we to interfere?

Just my 2 cents.

Lou

Old issues of Hints and Kinks and also the Radio Cyclopedia have directions
on making your own mica caps, as well as paper/foil capacitors. If you
are going to homebrew it, why not do it all the way? It would be appropriate
for the time period.

With a modern DVM, doing cut-and-try work to get the values right will be
much easier than it was eighty years ago, too.

> How about we stick to the pros and cons and not make personal attacks?
> We're way OT as it is.

One of the co-inventors of the transistor was famous for another reason:
he espoused his opinions about Africans being inferior because he said
their brains were small. World-famous scientists, or authors, or anybody
else with training in a specialized discipline, should be questioned
just like the greenest college student when they speak outside their
area of expertise.

There are, sad to say, cases where ad hominem attacks are warranted, and
this is one of them. The original post is off-topic, but that's a minor
offense on Usenet. However, the claims _ARE_ laughable, and anyone who
champions such nonsense deserves to be offered a discount on a bridge:
if nothing else, it's a chastening reminder that, in the future, those
who were disposed to believe them should drop a gold brick on the ground
before negotiating a purchase.

Paraphrasing Richard Pryor: "Your dignity will heal a lot faster than
your bank account balance".

William
P.S. I would set the followups, but I can't think of a group where this
discussion belongs.

LOL.......... Believe it or not - someone probably has already thought of
trying it OR done it.
Some guys (and gals) will try "anything" to make life interesting. NOTHING
surprises me anymore - but it sure makes for some good reading!

Next case please?

Quite similar to the steam boiler scale control products.

I had on guy come around with a thing you clamped around
the feedwater pipe going into the boiler. He claimed it was ultrasound
or something like that. I asked him if he would replace a $80,000.00
boiler if it was damaged from scale buildup and he left.

Obviously he did not believe in his own product.

William, I was with you until this paragraph. Even the most laughable claims, in my opinion, warrant one of two reactions online: Ignore them, or explain, using facts and not just assertions, why you believe them to be nonsensel. I disagree that ad hominem attacks are EVER appropriate in response to a claim concerning UFOs, fuel line magnets, political conspiracies--you name it. My usual response is to roll my eyes and move on. The only reason I posted this time was because the issue has been researched by responsible parties and I thought it might be worthwhile to make that known.

Why bother with personal attacks? The faceless, no-consequences Internet makes that too easy as it is. No way do I believe that some of the meanspirited garbage that stains too many NGs (spend 15 minutes on antiques radio/phono or shortwave) would come from somebody's mouth in a real conversation, even one conducted over the phone and not in person.

That too - hasn't stopped some from "trying". When I was doing a stint as a medic, I heard a doctor talking about a patient who had a "light bulb" of the conventional type - "attempted" to be stuck up his anal cavity in a feat of sexual pleasure - and it "busted" leaving shards of glass up in the rectum.

People do the weirdest things. As I said in a previous post - "nothing" surprises me - but it sure makes for some interesting reading.

You are correct, in the sense that an "ad hominem" attack is against a person instead of his/her argument: it's a logical fallacy, and should be avoided for that reason. However, as you point out, another poster had already refuted the claim: I though it obvious that no further evidence was needed.

Someone who asserts that the moon is made of green cheese, or that the earth is flat, or that magnets affect gasoline - or that Africans are inferior - should be answered with skepticism. Even the most wild speculation can attain the status of "fact" when enough people believe it: my father was fond of saying "A million Frenchmen can't be wrong", and Joseph McCarthy proved that Americans are never short on gullibility, so I remain convinced that an appeal to preconceived notions, either of racial purity or oil company conspiracies, deserves, if not derision, at least to be received with an extra measure of caution.

In other words, the burden of proof is on the claimant: if someone believes that magnets can improve gasoline mileage, let him step up and demonstrate it. If he can't, let him take his lumps.

I'm sorry to crabwalk here, but I believe my concerns are real, and I have seen otherwise "normal" people hire "Feng shui" "practitioners" to place magnets in their work cubicle (so as to assure that the stars were in alignment or the worm had turned or the entrails were favorable, or whatever it is that convinces "normal" people to open their wallets). The one constant of the human race is that David Hannum _was_ right: "There's a sucker born every minute".

Our history has shown that a million suckers _can_ be wrong, but it also demonstrates, as Galileo would attest, that they can be very vicious when confronted with the newest version of the truth. I know I make your argument for you here, but with a point in mind: those with outlandish ideas had best be ready for a lot of hard stares and possess a lot of hard facts.

William
P.S. Suggestions as to a more appropriate forum are, of course, welcome.

At the risk of repetition and belaboring the obvious, there isn't
anything at all in your response with which I disagree. "An extra
measure of caution"..."answered with skepticism": exactly.

sci.skeptic is one place that someone who is genuinely curious about an improbable claim
might find help. It is no place for those who believe regardless of the lack of evidence.

I was interested in doing the mods as outlined in the above referenced
field service notes.
I had downloaded the info from bama a long time ago and am just now
starting to get the rx into working codition.

Xtals are used in upper/lower side band select which replaces L6
assembly. I a surprised to
learn that ICM is able to research the NC-300 that well. These guys must
be good!

Royden R. Freeland founded International Crystal Manufacturing Company
(ICM) -- a true garage operation start in early 1950s. He was a great asset
to the radio industry.
http://www.icmfg.com/

In 1978, Royden Freeland Sr. and his wife were killed in an airplane crash.
The ICM operation was then continued by their son, Royden Freeland Jr.
taking day to day control of operations.

They have a very DEEP knowledge library of radios.

They were a staple for the land mobile radio service (Motorola, GE, RCA,
Johnson, etc.)
and Collins selected them as a major crystal supplier.

They have traditionally been amateur radio / experimenter friendly.

We've all had experience with radios that refuse to work
properly. The latest one for me has been an HT-44 transmitter.
Been driving me nuts.

Finally discovered why. Hallicrappers decided to use steel
rivets to attach the tube sockets and terminal strips to their
aluminum chassis. To their credit, they
did put star lock washers between the bodies of the sockets
and the chassis, but over time, the rivets corroded and
are giving a poor ground. Time to dig out the bus wire.

I'm sure other manufacturers did the same thing. An issue
thats worth keeping in mind when working on them.

Not only on radio's... I own an Alfa Romeo 33 car, with an all-aluminium boxer engine. Guess how bad the grounding of the alternator gets after some years? I sanded down all contact surfaces and placed such washers where possible. I should have added a jumper wire, but i didn't have the correct materials handy at the time.

This problem isn't restricted to aluminum chassis. ANY riveted ground
connection in an old radio is suspect.

I used to use copper pop rivets with steel chassis. After the items
were riveted, I used a 80 watt soldering iron to solder the inside end
of the rivet to the metal socket or terminal strip, and the chassis. I
NEVER had a grounding problem when i used this method.

My suspicion is that this radio is sufficiently drifty to begin with that using a high precision crystal is probably a waste of money. But I could see someone recommending it, and it wouldn't hurt anything.

They are good, and they have been around a long time. They were making the kits for the NC-300 when it was a current production product, and they still have all the original documentation for everything they ever did.

Im trying to find info on a Kokusai Electric MF-4510AZ121 mechanical filter.

Any ideas?

Cant seem to find anything on the net regarding this filter.

Thanks and Happy Holidays, Gil

4890. WTB: Aircraft equipment rack (shockmount)

Looking for a shockmount for a piece of airborne equipment. The box is 5" wide and 19 3/4" deep. The mount should have 4 shock mounts and the two standard securing locks on the front edge. Beyond that, anything will be fine. Condition not too important if it can be cleaned up. Its for a 1945 piece of gear so I'm not certain its a standard ATR size mount. Rear setup of rack unimportant, e.g.: connectors, etc. Worst case, I'll accept something wider (only) that I could cut down in width. Thanks much, de K3HVG

Sweep generator and a scope. Put something in, watch what comes out.

Odds are it's got a 455 KC passband, but if you sweep around 455 KC
and nothing comes out, try something wider.

If you don't have a sweep generator, even manually sweeping a signal
generator should let you see the center frequency and the filter width.

However, to find the output impedance, you want to add shunt resistance
to the thing until the passband looks nice and flat, and that is MUCH
easier to do with a sweep generator.

But those are really the only three things you care about: width, center
frequency, and output Z.

If so, would you email the image?

Thanks !

Bob W1CNY
